1.1 KONSTBYGGNADSTYP

Konstbyggnaden utgörs av en balkbro utförd som en sluten tät ställåda. Bron är utförd i totalt 9 st spann.

Samliga stöd utförs med bottenplatta på packad fyllning.

Under spann 2, 3 och 9 förekommer vägtrafik medan tågtrafik förekommer under spann 6, 7 och 8. Övriga spann motsvaras av gångtrafik.

Stöd 5 och 6 förses med fasta lager medan övriga stöd förses med rullager.

Bron är försedd med ett permanent tak. Räcket är 1.4 m högt och utformat i glas.

Farbana består av 65 mm gjutasfalt direkt mot stålfarbanan.

Stöd 3, 4 och 9 dimensioneras för påkörning av vägtrafik.

Stöd 6, 7, 8 och 9 förutställs avslagna vid påkörning av tågtrafik.

Övriga stöd förutsätts inte berörda av påkörning.

1.10 TB OCH SPRICKKRITERIER

Exponeringsklasser är bestämda enligt TRVR Bro avsnitt D.1.3 samt SS-EN 206-1.

Klassindelningar bro:

Konstruktionsdel	Säkerhetsklass	Livslängdsklass	Exponeringsklass
▫ Bottenplattor	3	L100	XC2 / XF3
▫ Pelare stöd 3, 4 och 9	3	L100	XD3 / XF4
▫ Pelare stöd 2 och 5-8	3	L100	XC2 / XF3
▫ Landfäste exkl. bottenplatta	3	L100	XC2 / XF3

Anm. Definition av vägmiljö se TRVFS kapitel 22 §5.

Klassindelningar stödmurar:

Konstruktionsdel	Säkerhetsklass	Livslängdsklass	Exponeringsklass
▫ Bottenplattor	3	L100	XC2 / XF3
▫ Frontmur	3	L100	XD1 / XF4

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A1:42
		Date :	Created :

Dimensioneringsparametrar för föga korrosionskänslig armering tillhörande bro:

$c_{min,dur}$	: minsta täckskikt med hänsyn till miljöpåverkan
$c_{min,b}$	: minsta täckskikt med hänsyn till krav på vidhäftning
Δc_{dev}	: utförandetolerans enligt SS-EN 1992-1-1 §4.4.1.3
$c_{min} = \max\{c_{min,b}; c_{min,dur}; 10mm\}$	: SS-EN 1992-1-1 ekvation 4.2
$c_{nom} = c_{min} + \Delta c_{dev}$	: SS-EN 1992-1-1 ekvation 4.1

Konstruktionsdel	$\zeta^{1.)}$	$w_k^{2.)}$	$v_{C_{tekv}}^{3.)}$	$c_{min,dur}^{3.)}$	$c_{min,b}^{4.)}$	c_{min}	Δc_{dev}	$c_{nom}^{5.) 6.)}$
▫ Bottenplatta sida mot fyllning	1.0	0.40	0.50	15	40	40	10	100
▫ Bottenplatta i övrigt	1.0	0.40	0.50	15	40	40	10	50
▫ Pelare stöd 3, 4 och 9	1.8	0.15	0.40	45	40	45	10	55
▫ Pelare stöd 2 och 5-8	1.0	0.40	0.50	15	40	40	10	50
▫ Landfäste exkl. bottenplatta	1.0	0.40	0.50	15	40	40	10	50
	-	mm	-	mm	mm	mm	mm	mm

Fotnoter

- 1.) Enligt SS-EN 1992-1-1 bilaga NA §7.3.2 tabell c
- 2.) Enligt SS-EN 1992-2 bilaga NA §7.3.1 tabell a
- 3.) Minsta betongskikt av miljöpåverkan enligt SS-EN 1992-1-1 bilaga NA §4.4.1.2 tabell a.
- 4.) Minsta betongskikt av vidhäftning enligt SS-EN 1992-1-2 §4.4.1.2 motsvarande $\max\{\phi; \text{stenmax}+5mm\}$. Erhållet värde avrundas uppåt.
- 5.) Nominell tjocklek som anges på ritning.
- 6.) Vid gjutning direkt mot fyllning ska de nedre 50 mm betraktas som statisk överksam enligt TRVK Bro D.2.2.1.4 och TRVR D.1.3.3 $\Rightarrow c_{nom} = c_{min} + \Delta c_{dev} + 50mm$

Stenmax = 32 mm $\rightarrow c_{min,b} = 37$ mm men 40 mm väljs på säker sida !

2.1 ALLMÄNT

Bron utgörs av en stål överbyggnad med mellanstöd av stål. Ändstöden är utformade i betong.

Överfläns, liv och underfläns utformas som skalelement.

Inuti ställåda förekommer totalt 3 st olika tvärförband betecknad typ R (∴ ansluter till räckesstolpar), typ T (∴ ansluter till pelare för takkonstruktion) och typ S (∴ stödläge). Samtliga tvärförband utformas som skalelement.

Överflänsen utformas med 4 st längsgående avstyvningar utformade som U-profiler. Dessa modelleras som 8 st ekvivalenta 3D-balkelement utformade som L-profiler.

Underflänsen en utformas med 3 st längsgående avstyvningar utformade som U-profiler. Dessa modelleras som 6 st ekvivalenta 3D-balkelement utformade som L-profiler.

Takkonstruktion, räckan, mellanstöd och ändstöd utformas som 3D-balkelement.

Lagren utformas med ekvivalenta fjädrar som medger fri rotation , styv förskjutning i z-riktning samt varierande styvhet horisontalplanet beroende på typ av lager (betecknas *Joint JNT4*).

Totalt tillverkas 9 st balkar i verkstad betecknad Balk 001- Balk 009. Dessa balkar ihop fogas genom montagesvetsning. Även takkonstruktion medföljer balken från verkstag.

Med anledning av detta förekommer totalt 9 st olika statiska system enligt redovisning nedan.

Del	System 1	System 2	System 3	System 4	System 5	System 6	System 7	System 8	System 9
Balk 001	Aktiv	Aktiv	Aktiv	Aktiv	Aktiv	Aktiv	Aktiv	Aktiv	Aktiv

2.2 SYSTEMSKISS

2.2.1 Geometri

För att beskriva geometri i krävs först att *POINTS* definieras. Utifrån dessa genereras *LINES* och *SURFACES*.

Balkelement definieras genom att införa attribut på *LINES*.
Skalelement definieras genom att införa attribut på *SURFACES*.

Bifogade bilder är hämtade ifrån gjord analys och ger en grafisk kvittens av *POINTS*, *LINES* och *SURFACES*.

Alla koordinater för att beskriva *POINTS* återfinns i bilaga 1-13.

Samtliga *POINTS* som beskriver *LINES* återfinns i bilaga 1-13.

Samtliga *LINES* som beskriver *SURFACES* återfinns i bilaga 1-13.

2.3.2.2 Ändstöd

Ändstöden utformas med en fiktiv stel länk. Förenkling godtas ty styvhet i tvärled är mycket hög jämfört med mellanstöd. I längsled har styvheten ingen betydelse.

3D Joints

Element Description

A 3D joint element which connects two nodes by three springs in the local x, y and z-directions.

Number Of Nodes

4. The 3rd and 4th nodes are used to define the local x-axis and local xy-plane.

Freedsoms

U, V, W: at nodes 1 and 2 (active nodes).

Node Coordinates

X, Y, Z: at each node.

Det förekommer 2 st typer av JNT4 element med olika materialegenskaper. Den ena tillämpas för såsom rullager med den andra som fast lager.

3.2 BELÄGGNING

Beläggningen utgörs av 65 mm gjutasfalt.

Bestämning av tillhörande lasteffekt sker enligt TRVK Bro 11 avsnitt B.3.1.1 enligt redovisning nedan.

$$q_z = -\gamma_{belägg} \cdot t = -24 \cdot \frac{kN}{m^3} \cdot 0.065m = -1.6 \frac{kN}{m^2}$$

Loadcase : BELÄGG

Structural loading : Global distributed

Load per unit area in Z direction (q_z) : $-1.6 \frac{kN}{m^2}$

☐ Total
☐ Per unit length
☒ Per unit area

Component	Value
X Direction	0.0
Y Direction	0.0
Z Direction	-1.6

Name BELÄGG (11)

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:14
		Date :	Created :

3.3 JORDTRYCK

Jordtryck bestäms motsvarande förstärkningslager material enligt TK Geo 11 tabell 5.2-1 och tabell 5.2-4 enligt redovisning nedan.

$$\phi_{m,\phi} = 1.30 \quad : \text{SS-EN 1997-1 bilaga NA tabell A.4}$$

$$\phi_{m,E} = 1.20 \quad : \text{TK Geo CB.5}$$

$$\gamma = 22 \frac{kN}{m^3}$$

$$\gamma' = 13 \frac{kN}{m^3}$$

$$X_d = \frac{1}{\gamma_m} \cdot \eta \cdot \overline{X} \equiv \frac{1}{\gamma_m} \cdot X_k$$

$$\Rightarrow \phi_d = \arctan\left(\frac{\tan \phi_k}{\phi_{m,\phi}}\right) = \arctan\left(\frac{\tan 45^\circ}{1.3}\right) = 38^\circ$$

$$K_0 = 1 - \sin \phi_d = 0.39$$

3.4 STÖDFÖRSKJUTNING

Såväl vertikal (z-riktning) som horisontell (x- och y-riktning) stödförskjutning enligt TRVK Bro 11 avsnitt B.3.1.4 studeras enligt redovisning nedan.

Stödförskjutning i x-riktning utgår ty ger inte upphov till tvångskrafter.

Inverkan av horisontell och vertikal stödförskjutning behöver inte kombineras.

$\Delta y = \pm 10 \text{ mm}$: enligt OTB

$\Delta z = - 10 \text{ mm}$: tillämpas såsom teoretisk stödsättning. Antaget värde verifieras i senare skede vid kontroll av grundläggning.

3.5.2 Lastmodell 2 - punktlast

Lastmodellen utgörs av en godtyckligt placerad punktlast $P_{konc} = 10kN$ enligt SS-EN 1991-2 avsnitt 5.3.2.2 fördelad på en yta av 100 mm x 100 mm.

Detta ger upphov till en ekvivalent motsvarande $q_{ytlast} = \frac{P_{konc}}{A} = \frac{10kN}{0.1m \cdot 0.1m} = 1000kPa$

Lasten är endast dimensionerande lokalt för överflänsen ty LM1 ger samma last på området 0.67 m x 3.0 m enligt redovisning nedan.

$$0.67m \cdot 3.0m \cdot q_{LM1} = 0.67m \cdot 3.0m \cdot 5kPa = 10kN \equiv P_{konc}$$

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:53
		Date :	Created :

3.5.2 Lastmodell 3 - renhållningsfordon

Lastmodellen utgörs av renhållningsfordon enligt SS-EN 1991-2 avsnitt 5.3.2.3 samt OTB avsnitt DC-11.

Last tillhörande renhållningsfordonet uppgår till 6 ton med fördelningen enligt nedan.

För att förenkla lastmodellering tillämpas dock en last motsvarande 8 ton. Den förenkling är av ringa betydels ty inverkan av renhållningsfordon endast är av lokal betydelse då ytlast tillhörande LM 1 är större inom området 5.33 m x 3.0 m enligt redovisning nedan.

$$5.33m \cdot 3.0m \cdot q_{LM1} = 5.33m \cdot 3.0m \cdot 5kPa = 80kN \equiv P_{konc}$$

* = Punktlasten 20 kN tillämpas på säker sida.

Lasten är inte dimensionerande för överfläsen lokalt ty den ekvivalenta ytlasten tillhörande LM 2 är större enligt redovisning nedan.

$$\frac{P_{konc}}{A} = \frac{20kN}{0.2m \cdot 0.2m} = 500kPa < q_{ytlast}^{LM2} = 1000kPa$$

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:54
		Date :	Created :

Lasten modelleras såsom en diskret punkt last med princip utseende enligt figur nedan. Dessa införs i den statiska modellen genom att föreskriva belastningsytan FARBANA. Belastningsytan betecknas *Search Area*.

3.6 BROMSLAST

Bromskraft bestäms enligt SS-EN 1991-2 §5.4 kompletterade med OTB avsnitt DC-11.

Lasten är uppträder parallellt bron. Lasten beskrivs med för totalt ett lastläge beläget i mitten av spann 5 enligt figur nedan. Denna förenkling är utförs då en stöd 5 och stöd 6 är utformad med fasta lager i brons längdriktning.

$$F_{broms.} = 10\% \cdot (3.0m \cdot 5kPa \cdot 183.3m) = 275kN \quad : \text{LM 1}$$

$$F_{broms.} = 0.6 \cdot Q_{Renhåll} = 0.6 \cdot 60kN = 36kN \quad : \text{LM 3}$$

$$\Rightarrow p_x^{broms} = \pm \frac{F_{broms}}{l} = \pm \frac{275kN}{3.0m} = \pm 92 \frac{kN}{m}$$

3.8 ÖVERLAST

Överlast bestäms enligt SS-EN 1991-2 avsnitt 5.9 enligt redovisning nedan :

$q_{ytlast} = 5kPa$: vertikal belastning

$q_{över} = K_0 \cdot q_{ytlast} = 0.39 \cdot 5kPa = 2kPa$: horisontell belastning

Anm. På säker sida tillämpas dock 1 $q_{ytlast} = 5kPa$ med anledning av uttryckningsfordon uppe på motfyllning, se även SS-EN 1992-2 avsnitt 2.9 anmärkning 1.

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:70
		Date :	Created :

3.9 TEMPERATUR

Temperaturpåverkan på broar anges i TRVK Bro 11 avsnitt B.3.2.5 och EN 1991-1-5 § 6.1.

Monteringstemperatur : $T_{\text{mont}} = +10^{\circ} \text{ C}$

EN 1991-1-5A.1(3)

Längdutvidningskoefficient : $\alpha = 12 \cdot 10^{-6}$

Lådbalk i stål $\Rightarrow$ typ 1

Varaktighetskoefficienter :

Koefficienter enligt SS-EN 1990/A1 tabell A2.3

$$\psi_0 = 0.60$$

$$\psi_1 = 0.60$$

$$\psi_2 = 0.50$$

3.10.1 Jämn temperatur över hela tvärsnittet (JTEMP)

Lasten påföres hela överbyggnaden (= flänsar, liv, avstyvningar) exkl. räcke och takkonstruktion. Gynnsam inverkan av takkonstruktion har inte tillämpats på säker sida vid bestämning av dimensionerande temperatur.

Ort : Ludvika

$$T_{\max} = +35^{\circ}\text{C} \quad : \text{TRVFS 2011:12 Bilaga 2 tabell 2a}$$

$$T_{\min} = -40^{\circ}\text{C} \quad : \text{TRVFS 2011:12 Bilaga 2 tabell 2a}$$

Funktion enligt SS EN 1991-1-5 figur 6.1 (funktion till bro typ 1) :

$$T_e(T) = \text{interp} \left[(-50 \quad 0 \quad 30 \quad 50)^T \cdot ^{\circ}\text{C}, (-55 \quad -3 \quad 47 \quad 67)^T \cdot ^{\circ}\text{C}, T \right]$$

$$T_{e,\max} = T_e(T_{\max}) = 52^{\circ}\text{C}$$

$$T_{e,\min} = T_e(T_{\min}) = -45^{\circ}\text{C}$$

$$\Rightarrow T^+ = T_{e,\max} - T_0 = +52^{\circ}\text{C} - 10^{\circ}\text{C} = +42^{\circ}\text{C}$$

$$\Rightarrow T^- = T_{e,\min} - T_0 = -45^{\circ}\text{C} - 10^{\circ}\text{C} = -55^{\circ}\text{C}$$

3.10.2 Ojämn temperatur över hela tvärsnittet (OJTEMP)

Linjär temperaturskillnad över tvärsnitt bestäms enligt EN 1991-1-5 § 6.1.4.1 för beläggningstjocklek 65 mm och typ 1.

Lasten påföres hela överbyggnaden genom att införa jämn temperatur i överfläsen.

Gynnsam inverkan av takkonstruktion har inte tillämpats på säker sida vid bestämning av dimensionerande temperatur.

$$k_{1,sur} = 1.0 - 0.30 \cdot \frac{15mm}{50mm} = 0.91 \text{ men } 1.00 \text{ tillämpas på säker sida !}$$

$$k_{2,sur} = 1.0 + 0.20 \cdot \frac{15mm}{50mm} = 1.06 \text{ men } 1.38 \text{ tillämpas på säker sida !}$$

$$\Delta T_{\max} = +18^{\circ}C \cdot k_{1,sur} = +18^{\circ}C \quad : \text{ överyta varmare}$$

$$\Delta T_{\min} = -13^{\circ}C \cdot k_{2,sur} = -18^{\circ}C \quad : \text{ underyta varmare}$$

Anm. Gynnsam inverkan av tak är ej beaktad.

3.10 VINDLAST

Vindlast på broar anges i EN 1991-1-4 §8.

Vindlast förekommer i samtliga riktningar med anses utgå i x-riktning dvs $F_{\text{vind},x} = 0 \text{ kN}$.

Vindlast anses endast förekomma mot bro genom att anta att den är helt tät i y-riktningen.

Anm. Trots att TRVK B.3.2.6.1 a anger att vindlast är ett objektspecifikt byggherreval så tillämpas SS-EN 1991-1-4. Valet anses på säker sida med anledning av den betydande brolängden.

	Part A - CALCULATION ASSUMPTIONS	Status :	Page: A3:83
	Steel box pedestrian bridge	Date :	Created :

Terrängtyp II tillämpas på säker sida enligt SS-EN 1991-1-4 Tabell 4.1

$$h_1 = H1 - H4 = +162.5m - 0.90m = 5.8m \quad : \text{avstånd från mark till UK stålbalk}$$

$$h_2 = h_1 + 4.7m = 5.8m + 4.7m = 10.5m \quad : \text{avstånd från mark till ÖK tak}$$

$$\Rightarrow h \cong \frac{h_1 + h_2}{2} = 8.1m$$

$$v_b(\text{Ludvika}; z = 10m; z_0 = 0.05m) = 22 \frac{m}{s} \quad : \text{TRVFS 2011:12 Bilaga 4 tabell 4.1}$$

$$q_p(h = 8m; \text{Terrängtyp II}, v_b = 22 \frac{m}{s}) = 0.61 \frac{kN}{m^2} \quad : \text{TRVFS 2011:12 Bilaga 4 tabell 4.2}$$

$$q_b = \frac{1}{2} \cdot \rho \cdot v_b^2 = \frac{1}{2} \cdot 1.25 \frac{kg}{m^3} \cdot \left(22 \frac{m}{s}\right)^2 = 0.30 \frac{kN}{m^2}$$

$$c_e = \frac{q_p}{q_b} = \frac{0.61kPa}{0.30kPa} = 2.03$$

$$b = 6.4m$$

$$\Rightarrow \frac{b}{d} = 1.36$$

$$d_{tot} = 4.7m$$

Varaktighetskoefficienter :

Koefficienter enligt SS-EN 1990 bilaga A2 tabell A2.1

3.11 SNÖLAST

Utvärdering av snölast sker enligt TRVK Bro 11 avsnitt B.3.2.4 och SS-EN 1991-1-3 kapitel 5.

Taket skall förses med snörasskydd.

$$s_k(50\text{år}) = 2.5kPa \quad : \text{SS-EN 1991-1-3 bilaga NB}$$

Variationskoefficienten enligt TVFS 2011:12 kapitel 4§12 används för att bestämma karakteristisk snölast för 120 år.

$$v = 0.60 - 0.25 \cdot \frac{1.5kPa}{2.0kPa} = 0.41$$

Karakteristisk snölast under 120 år bestäms enligt SS-EN 1991-1-3 bilaga D.

$$\eta = \frac{1 - v \cdot \frac{\sqrt{6}}{\pi} \cdot \left(\ln \left(-\ln \left(1 - \frac{1}{120} \right) \right) + 0.57722 \right)}{1 + 2.5923 \cdot v} = 1.14$$

$$s_k(120\text{år}) = s_k(50\text{år}) \cdot \eta = 2.9kPa$$

Varaktighetskoefficienter enligt SS-EN 1991-1-3 tabell 4.1 :

$$\psi_0 = 0.70$$

$$\psi_1 = 0.50 \text{ (borde vara 0.40 dock på säker sida)}$$

$$\psi_2 = 0.20$$

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:98
		Date :	Created :

$$s = \mu_i \cdot C_e \cdot C_t \cdot s_k(120\text{år}) \quad : \text{SS-EN 1991-1-3 ekv. 5.1}$$

$$C_t = 1.00 \quad : \text{SS-EN 1991-1-3 avsnitt 5.2}$$

$$C_e = 1.00 \quad : \text{SS-EN 1991-1-3 tabell 5.1}$$

Bestämning av formfaktor sker för sadeltak enligt SS-EN 1991-1-3 avsnitt 5.3.3 :

$$\alpha = \arctan\left(\frac{943\text{mm}}{3200\text{mm}}\right) = 16^\circ \Rightarrow \mu_1 = 0.80$$

$$\mu_2 = 0.5\mu_1 = 0.40$$

$$s_1 = \mu_1 \cdot C_e \cdot C_t \cdot s_k(120\text{år}) = 0.80 \cdot 1.0 \cdot 1.0 \cdot 2.9\text{kPa} = 2.4\text{kPa}$$

$$s_2 = \mu_2 \cdot C_e \cdot C_t \cdot s_k(120\text{år}) = 0.40 \cdot 1.0 \cdot 1.0 \cdot 2.9\text{kPa} = 1.2\text{kPa}$$

3.12 PÅKÖRNINGSLAST

Bron skall dimensioneras för exceptionella dimensioneringssituationer motsvarande påkörning av väg- och järnvägsfordon enligt TRVK Bro 11 kapitel B.5.

3.12.1 Påkörning av järnvägsfordon

Mellanstöd närmare än 10 meter från spårmitt skall dimensioneras för risken för påkörning. Detta medför att stöd 6-9 kontrolleras.

Någon dimensionering av dessa stöd förutsätts inte ske ty de förutsätts bortslagna enligt vad som anges i TK Bro 11 avsnitt B.5.2.3.2.

Samtliga dessa stöd anses utgöras av bärverk Klass A enligt SS-EN 1991-1-7 avsnitt 4.5.1.2.

Samtliga stöd anses oskyddade och belägna inom avståndet $3\text{ m} < d < 5\text{ m}$ ifrån spårmitt.

$F_Y = 4000\text{ kN}$: last vinkelrätt bro enligt SS-EN 1991-1-7 tabell 4.4

$F_X = 1500\text{ kN}$: last parallellt bro enligt SS-EN 1991-1-7 tabell 4.4

Trafiklasten angripa 1.8 m ovanför RÖK.

Anm. Mellanstöd utsatta för påkörning av tågtrafik förutsätts avslagna.

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:104
		Date :	Created :

3.12.2 Påkörning av vägfordon

Säkerhetszonen bestäms enligt VGU med förutsättning av VR80 utan räcke med släntlutning $\leq 1:4$ (se Figur 1.1-14).

Sidomått för säkerhetszon från körbanekant : $s_{zon} = 3m + 8m = 11m$

Mellanstöd inom säkerhetszonen skall dimensioneras för påkörning.

Detta medför att stöd 3, stöd 4 och stöd 9 bör kontrolleras för påkörning. I ett sent konstruktionsskede har överbyggnaden dock utformats för att klara bortslagna mellanstöd. Detta då det inte gick att dimensionera stålpelare för den uppträdande lasten. Vid dimensionering av stödets betongdel har på säker sida kontroll utförts för påkörning.

Trafiklasten angripa 1.5 m ovanför marknivå/vägbanan vilket motsvarar last tillhörande lastbil.

Lastytan ($\Delta_z \times \Delta_{x,y}$) : 0.50 m x 1.50 m

Stöd 3, stöd 4 och stöd 9 :

$F_y = 500kN$: last vinkelrätt bro enligt SS-EN 1991-1-7 punkt 4.3.2(1)
tabell 4.1

$F_x = 250kN$: last vinkelrätt bro enligt SS-EN 1991-1-7 punkt 4.3.2(1)
tabell 4.1

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:105
		Date :	Created :

3.13 LASTKOMBINATIONER

Kontroll av bärförmågan skall utföras med de två förekommande skedena enligt redovisning nedan. Utvärdering av risken för utmattning utgår för studerad konstruktion.

Vid dimensionering tillämpas partialkoefficientmetoden enligt EN-1990.

Bärförmågan skall verifieras för brottgränstillstånd och bruksgränstillstånd.

Vid kontroll av brottgränstillstånd varierar lastkoefficienterna med hänsyn till brott typ enligt redovisning nedan.

EQU : Verifiering av risk för stjälpning av konstruktionen

STR/GEO : Verifiering av statisk och geoteknisk bärförmåga

Vid dimensionering tillämpas en "förenklad metod" för lastkoefficienter. Bestämning av de förenklade lastkoefficienterna utförs med beräkningsark PROG T060 där samtliga formler och delresultat redovisas.

	Part A - CALCULATION ASSUMPTIONS Steel box pedestrian bridge	Status :	Page: A3:106
		Date :	Created :

3.13.2 Brottgränstillstånd ULS

Denna lastkombination avser huvudbelastning för normal belastningssituation där de variabla lasterna är dominerande.

Lastkombination tillämpas vid verifiering enligt STR/GEO (uppsättning B).

Lastkombination definieras enligt EN-1990 ekvation 6.10a och 6.10b enligt redovisning nedan.

$$E_{Sd}^{10a} = \sum_{j \geq 1} \gamma_{G,j} \cdot G_{k,j} + \gamma_{Q,1} \cdot \psi_{0,1} \cdot Q_{k,1} + \sum_{i > 1} \gamma_{Q,i} \cdot \psi_{0,i} \cdot Q_{k,i} = \psi \gamma_{ULS-A} \cdot \left(\sum_{j > 1} G_{k,j} + \sum_{i > 1} Q_{k,i} \right)$$

$$E_{sd}^{10b} = \sum_{j \geq 1} \xi_j \cdot \gamma_{G,j} \cdot G_{k,j} + \gamma_{Q,1} \cdot Q_{k,1} + \sum_{i > 1} \gamma_{Q,i} \cdot \psi_{0,i} \cdot Q_{k,i} = \psi \gamma_{ULS-B} \cdot \left(\sum_{j > 1} G_{k,j} + \sum_{i > 1} Q_{k,i} \right)$$

Vid dimensionering tillämpas dock EN 1990 bilaga NA tabell A1.2(B).

Vid dimensionering tillämpas en ”förenklad metod” där lastkoefficienter tillhörande ekvation 6.10a betecknas ULS-A medan lastkoefficienter tillhörande ekvation 6.10b betecknas ULS-B.

Vid dimensionering tillämpas en ”förenklad metod” för lastkoefficienter tillhörande ekvationer 6.10a och 6.10b.

3.12.3 Bruksgränstillstånd

Bruksgränstillståndet är uppdelat i 3 st lastkombinationer beroende på dess varaktighet. Lastkombinationerna redovisas nedan.

Lastkombination	Varaktighet
SLS:K	Karakteristisk
SLS:F	Frekvent
SLS:Q	Kvasipermanent

Lastkombination SLS:K enligt EN 1990 ekv. 6.14b redovisas nedan.

$$E_{Sd} = \sum_{j \geq 1} G_{k,j} + Q_{k,1} + \sum_{i > 1} \psi_{0,i} \cdot Q_{k,i} = \psi \gamma_{SLS,K} \cdot (\sum_{j \geq 1} G_{k,j} + \sum_{i > 1} Q_{k,i})$$

Lastkombination SLS:F enligt EN 1990 ekv. 6.15b redovisas nedan.

$$E_{Sd} = \sum_{j \geq 1} G_{k,j} + \psi_1 \cdot Q_{k,1} + \sum_{i > 1} \psi_{2,i} \cdot Q_{k,i} = \psi \gamma_{SLS,2} \cdot (\sum_{j \geq 1} G_{k,j} + \sum_{i > 1} Q_{k,i})$$

Lastkombination SLS:Q enligt EN 1990 ekv. 6.16b redovisas nedan.

$$E_{Sd} = \sum_{j \geq 1} G_{k,j} + \sum_{i > 0} \psi_{2,i} \cdot Q_{k,i} = \psi \gamma_{SLS,Q} \cdot (\sum_{j \geq 1} G_{k,j} + \sum_{i > 1} Q_{k,i})$$

Vid dimensionering tillämpas en ”förenklad metod” för lastkoefficienter tillhörande ekvationer 6.14a, 6.15b och 6.16b.

3.12.4 Olyckslastfall

Olyckslastfallet betecknas även exceptionell lastkombination EXC enligt SS-EN 1990 avsnitt 6.4.3.3 ekvation 6.11a enligt redovisning nedan.

Olyckslastfallet betecknas A_d och utgörs för studerad bro av påkörning av vägfordon respektive tåg.

$$E_{Sd} = \sum_{j \geq 1} G_{k,j} + P + A_d + \psi_{1,1} \cdot Q_{k,1} + \sum_{i > 1} \psi_{2,i} \cdot Q_{k,i} = \psi \gamma_{EXC} \cdot \left(\sum_{j \geq 1} G_{k,j} + P + A_d + \sum_{i \geq 1} Q_{k,i} \right)$$
