Hydropower plant 2 (10 MW)

Table of content

Appendix

1. GENERAL/MEASUREMENTS

1.1 STRCTURAL TYPE

This report describes the design of a hydropower plant located between baseline 2 and baseline 4.

The structure is exposed to the loads mentioned bellow.

- Dead load
- Water load
- Live load
- Earthquake load

1.2 PRODUCTION SCHEME

The production scheme assumes that the structure is cast-in situ.

1.3 FOUNDATION

The foundation assumes the bottom slab rests directly on solid unweathered rock.

Theoretical foundation level : +67.00

Water level at completion : see table below

Level	Remark
+90.60	10000 year
+79.65	Design flow conditions
+78.65	Normal operations
m	-

Water level during production fase : < +67.00

Backfill : rockfill

2. STATICAL SYSTEM

2.1 GENERAL

The structure is designed as a reinforced concrete structure resting on unweathered rock.

The analysis is performed in two separate parts as seen below.

Part I : Analysis of bottom slab
Part II : Analysis of walls

2.1.1 Principle of Part I (Analysis of bottom slab)

The analysis of Part I is conducted using clamped or free rotational stiffness along edges where wall are situated. If there is a pit in connection to wall free rotational stiffness is introduced. If no pit is found then clamped rotational stiffness is introduced.

The bottom slab has varying thickness (1.18 m to 4.73 m). In the design however only a thickness of 1.18 m and 3.0 m are used on the safe side. The reason is to achieve production friendly reinforcement at “top”.

Loads applied to this structure is consists of ground pressure and dead weight.

Ground pressure is determined using a model where no overturning of structure is considered possible to due to edge beams and external slabs at base lines 2, 4 and A.

The edges beams act from level +67.0 to level +81.0.

The external slabs act from level +77.0 to level +78.0.

2.1.2 Principle of Part I (Analysis of walls)

The analysis of Part II is conducted using clamped rotational stiffness along edges of wall connected to level a top of bottom slab. I

In the water flow direction edge beams are modeled using support condition with rigid movement in the y-direction. The Boundary conditions act from level +67.0 to level +81.0 m.

The effect of the following parts Floor 1_4, Wall 2_2, Wall 3_4, Wall 3_5, Wall 3_6 and Wall 4_2 are only considered as loads. Not incorporating these parts into the analysis of walls in considered as on the safe side.

2.2 STATICAL MODELL

2.2.1 Model : Part I (Bottom slab)

In order to describe the structures geometry in first *POINTS* have to be defined. From these *LINES* and *SURFACES* are generated.

Shell elements are applied to *SURFACES*.

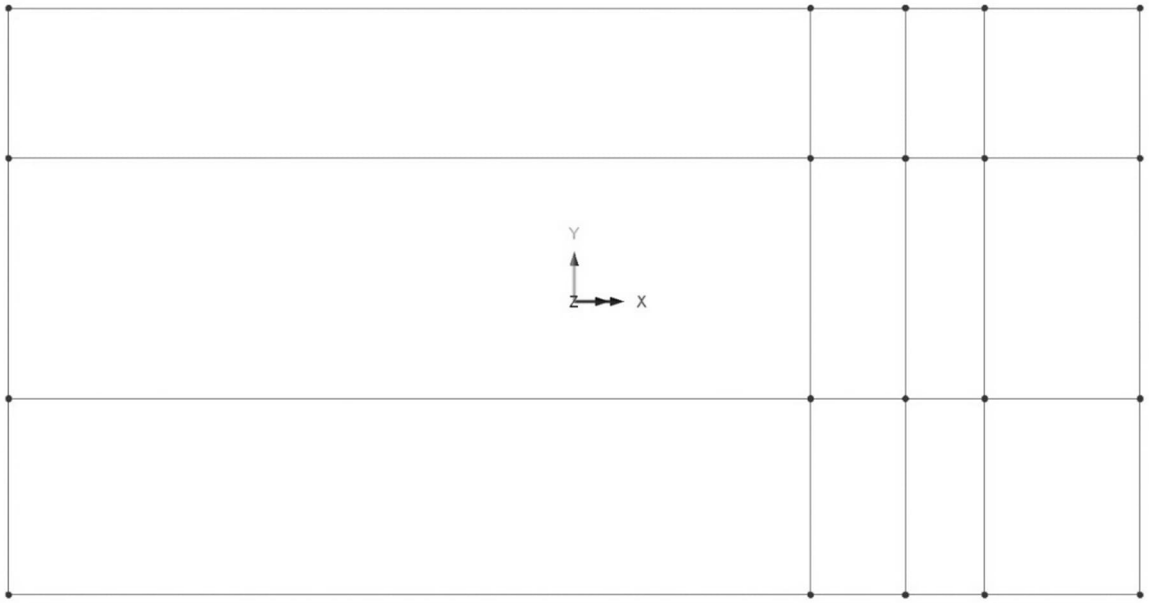
Beam elements are applied to *LINES.*

The following pictures are retrived from LUASAS in order to present a graphical presentation of *POINTS* and *SURFACES* used in the analysis.

All coordinates defining *POINTS* are presented in appendix 1.

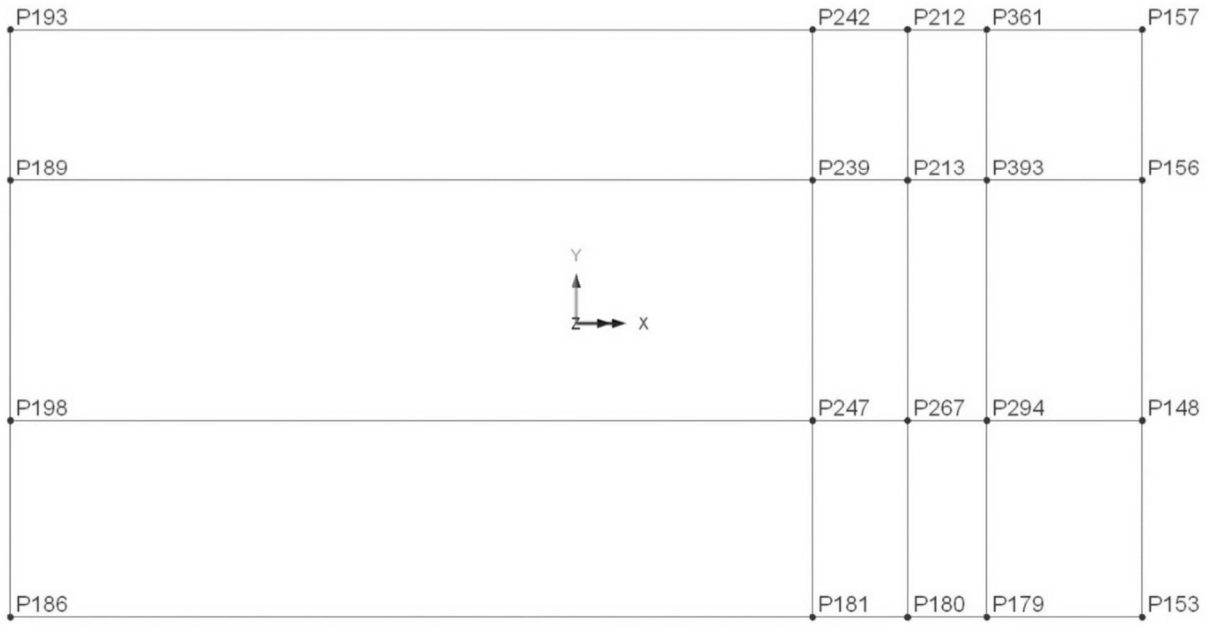
All *LINES* used to define *SURFACES* are presented in appendix 1.

Structural lines - overview :



2.2.1.1 Geometry : SURFACES

2.2.1.2 Geometry : POINTS

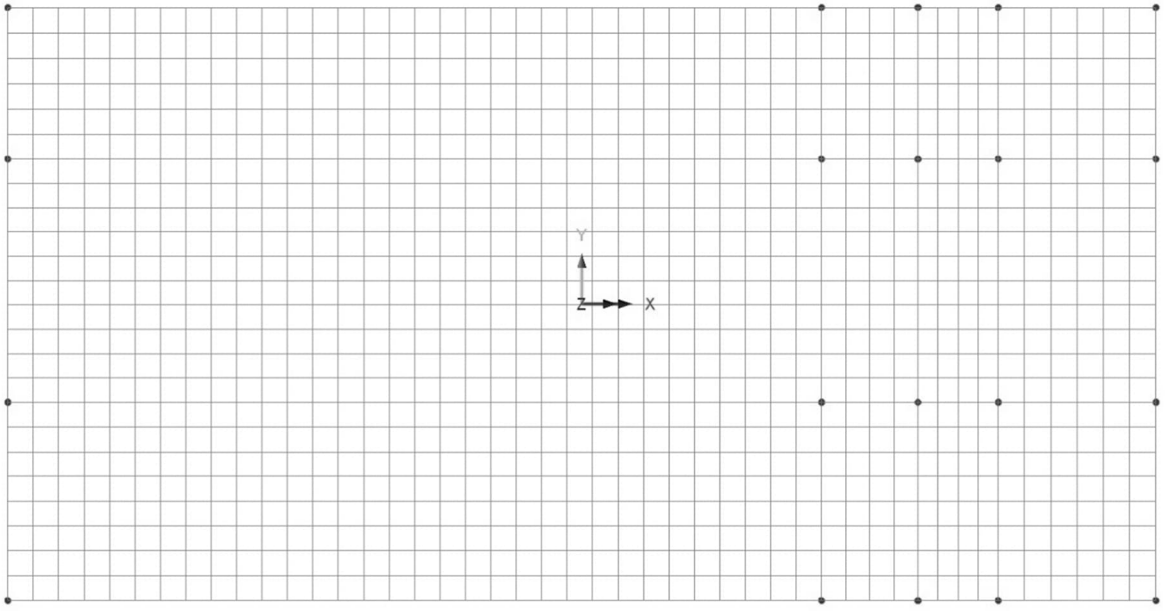


2.2.1.3 MESH

The proviously defined *SURFACES* are given attributes for generation of *MESH*.

During the generation of *MESH* the underlying *ELEMENTS* and *NODES* are created. They are found in appendix 1.

The structure is modelled with Shell elements (”Thick shell” / QTS4).



2.2.2 Model : Part II (Walls)

In order to describe the structures geometry in first *POINTS* have to be defined. From these *LINES* and *SURFACES* are generated.

Shell elements are applied to *SURFACES*.

Beam elements are applied to *LINES*.

The following pictures are retrived from LUASAS in order to present a graphical presentation of *POINTS* and *SURFACES* used in the analysis.

All coordinates defining *POINTS* are presented in appendix 2.

All *LINES* used to define *SURFACES* are presented in appendix 2.

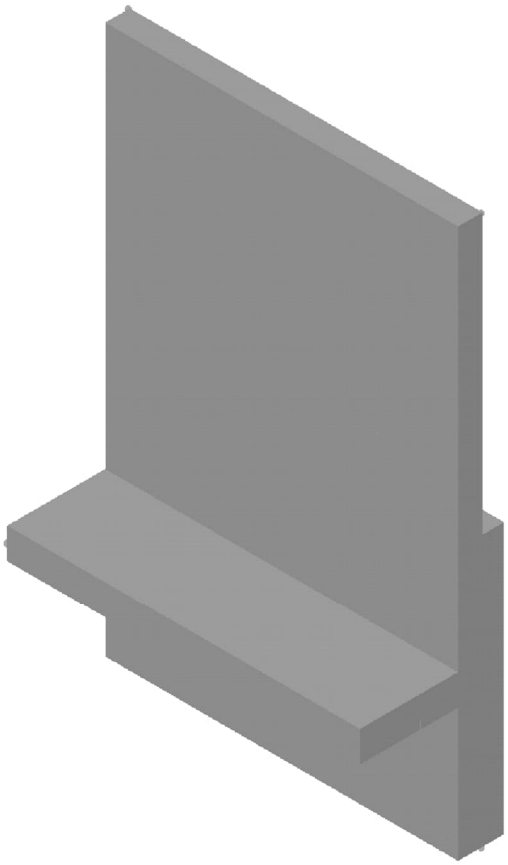
View – Wall 4 :



Structure	Type
Wall 4_1	Shell t = 1.50 m
Wall 4_2	Shell t = 1.00 m
Wall 4_3	Shell -t =0.80 m

2.4 MATERIAL

Concrete : E_{ck} = 30 GPa

Material	Värde
E	$30 \cdot 10^6$ kPa
ν	0.2 *
ρ	2400 kg/m^3

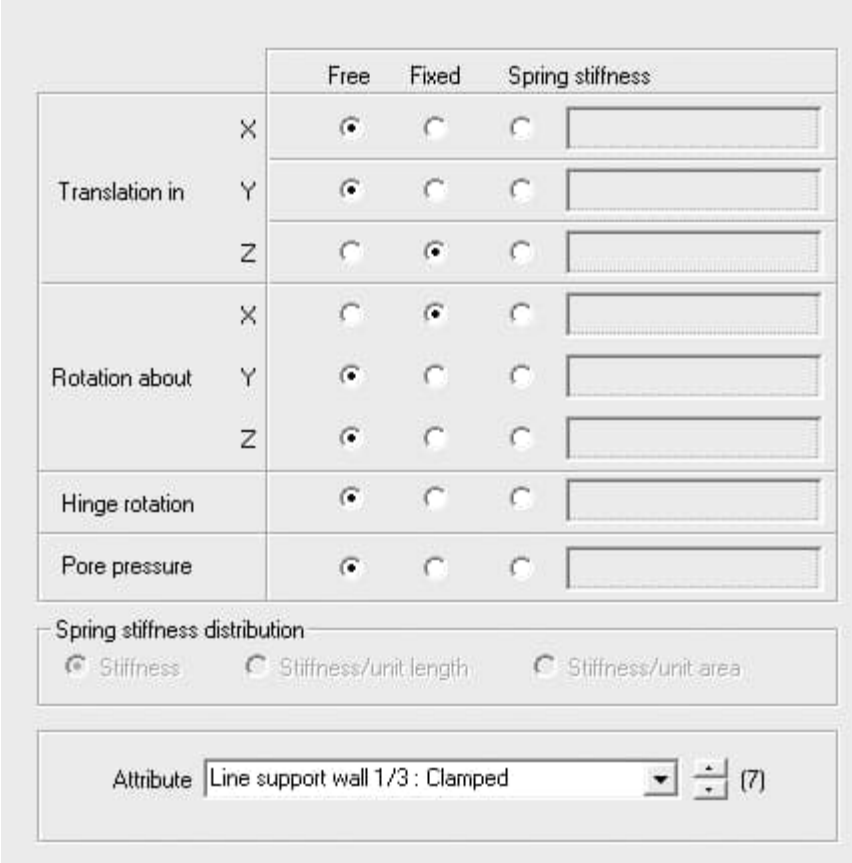
* = According to general engineering recommendation ν = 0 can be applied. However in the analysis ν = 0.002 is inserted.

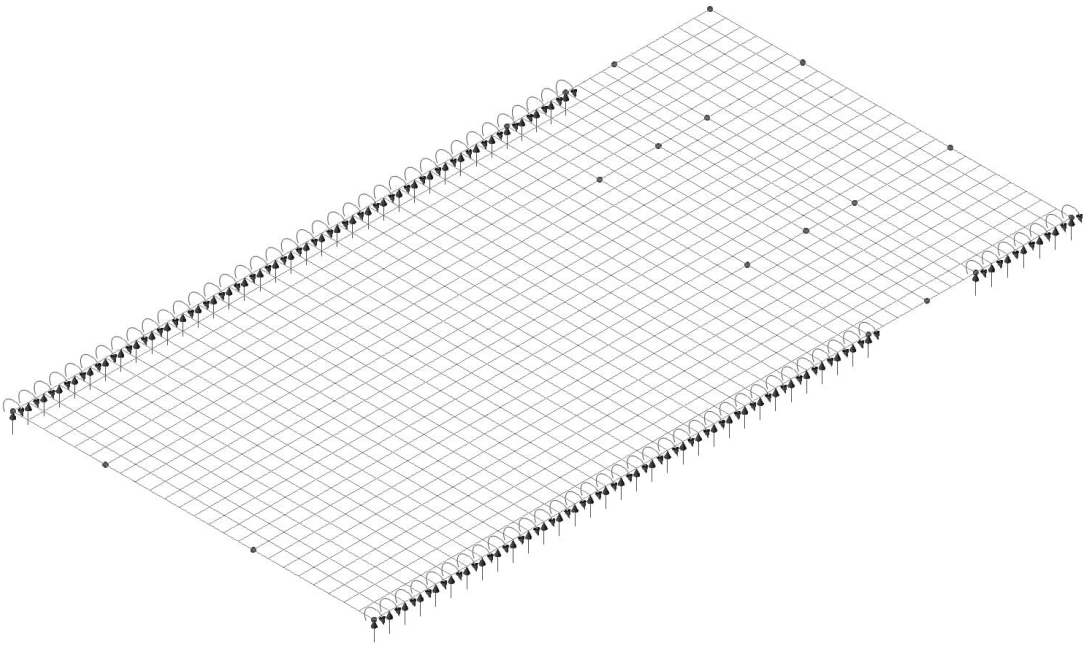
2.5 BOUNDARY CONDITIONS

The structure is studied in to separate parts. The boundary conditions for part I (bottom slab) and part II (walls) is presented in the following chapter.

2.5.1 Model : Part I (Bottom slab)

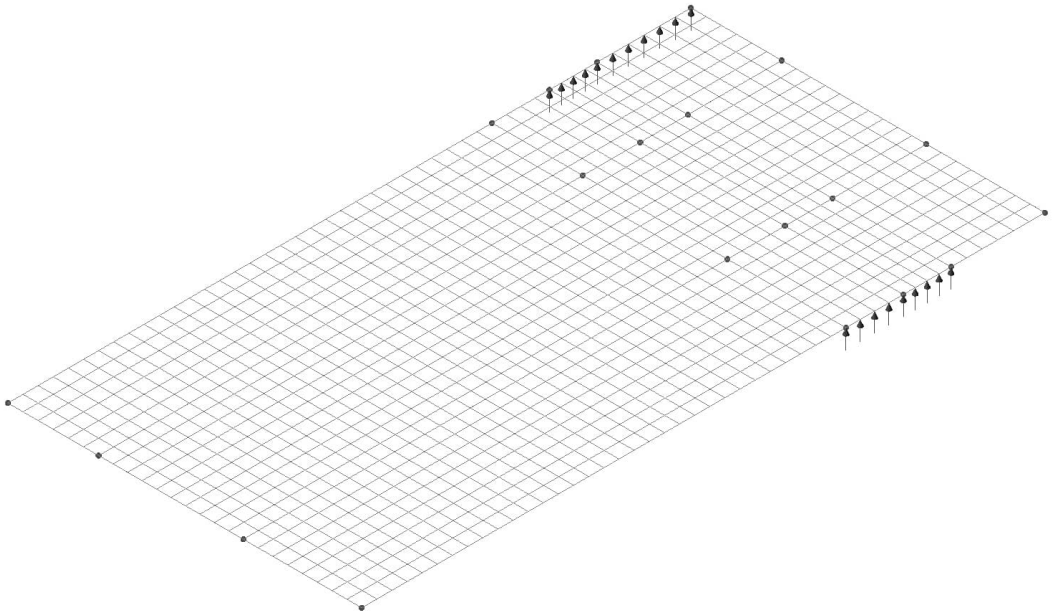
2.5.1.1 Boundary at foundation of wall 1/3 : “Line support wall 1/3:clamped”





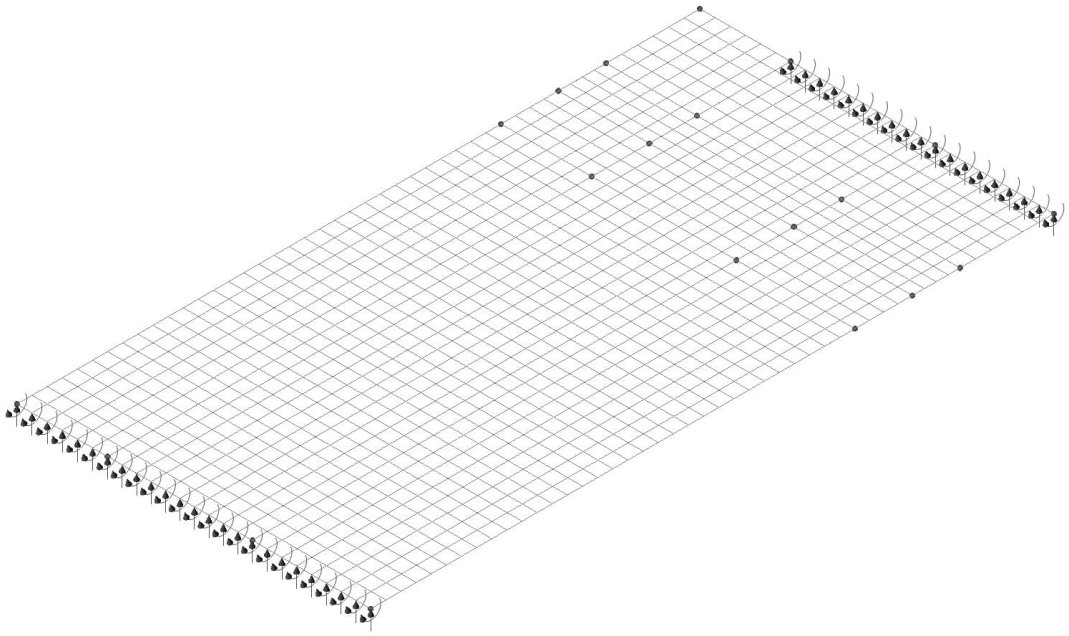
Remark Areas where there is concrete above the bottom slab. This corresponds to areas without pits.

2.5.1.2 Boundary at foundation of wall 1/3 : “Line support wall 1/3:free”

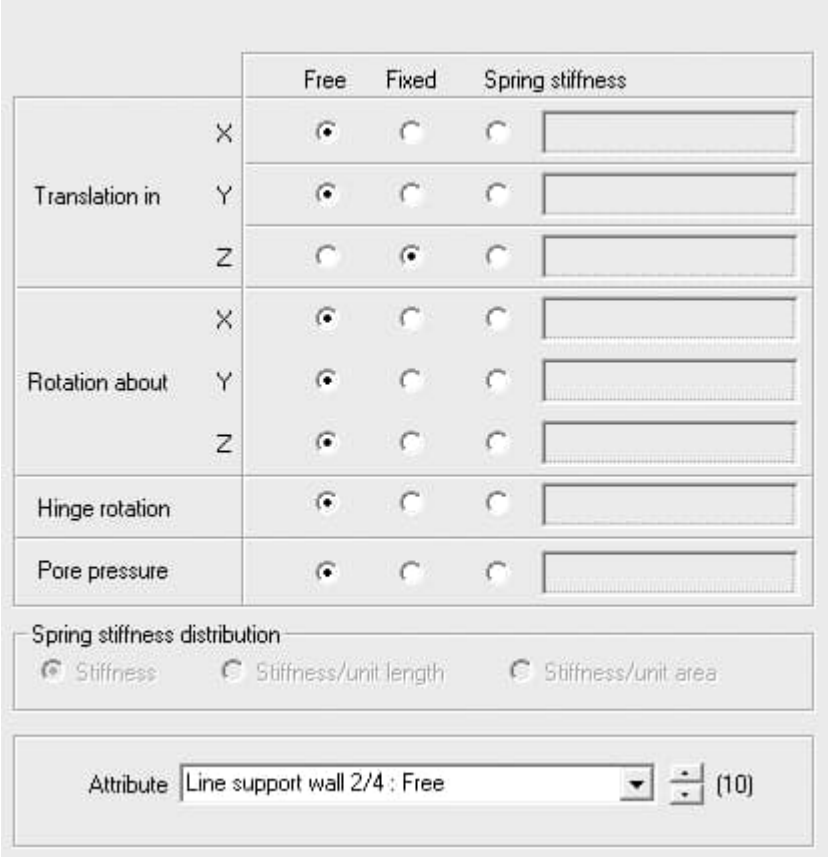


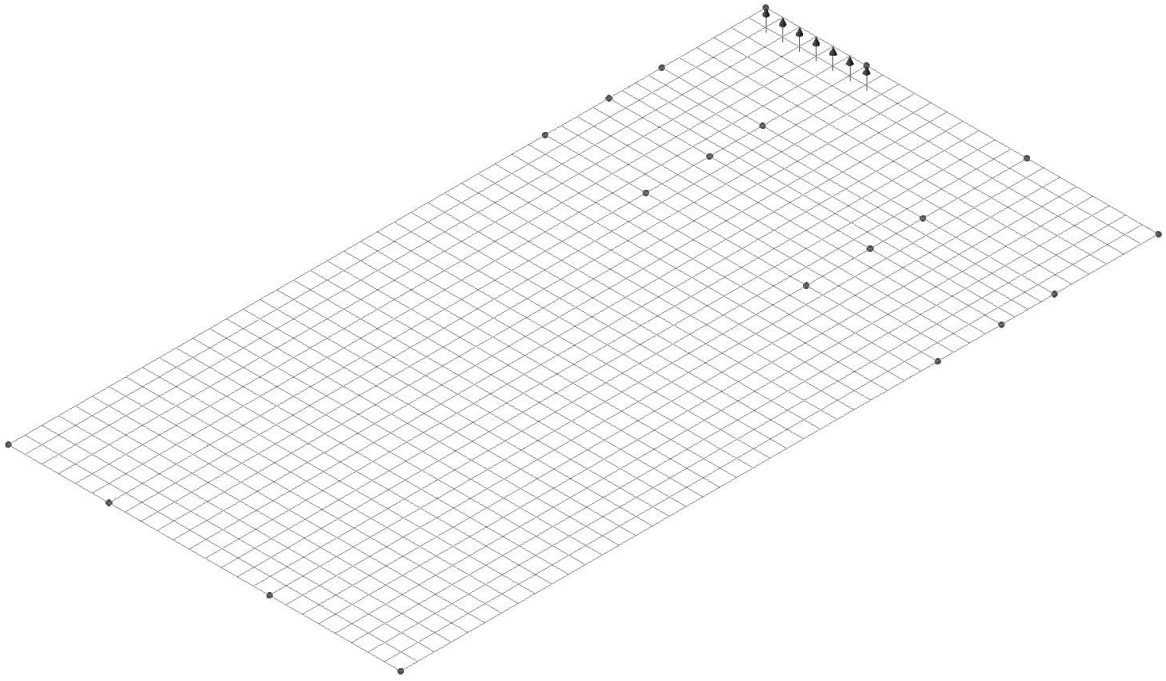
Remark Areas where there is no concrete above the bottom slab. This corresponds to areas with pits.

2.5.1.3 Boundary at foundation of wall 2/4 : “Line support wall 2/4:clamped”

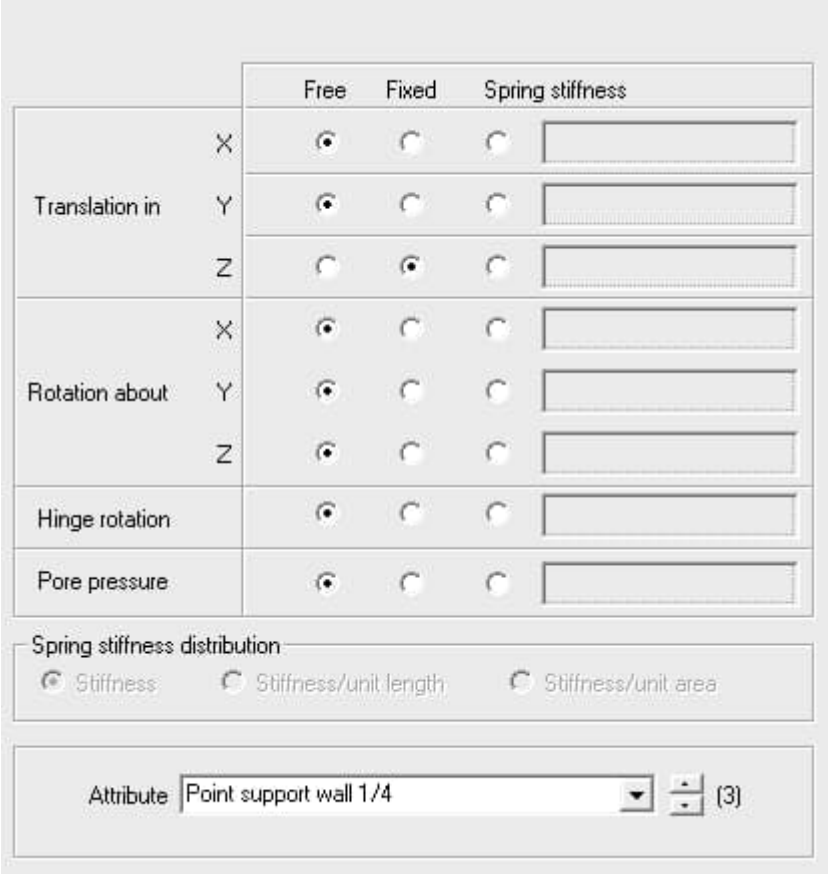


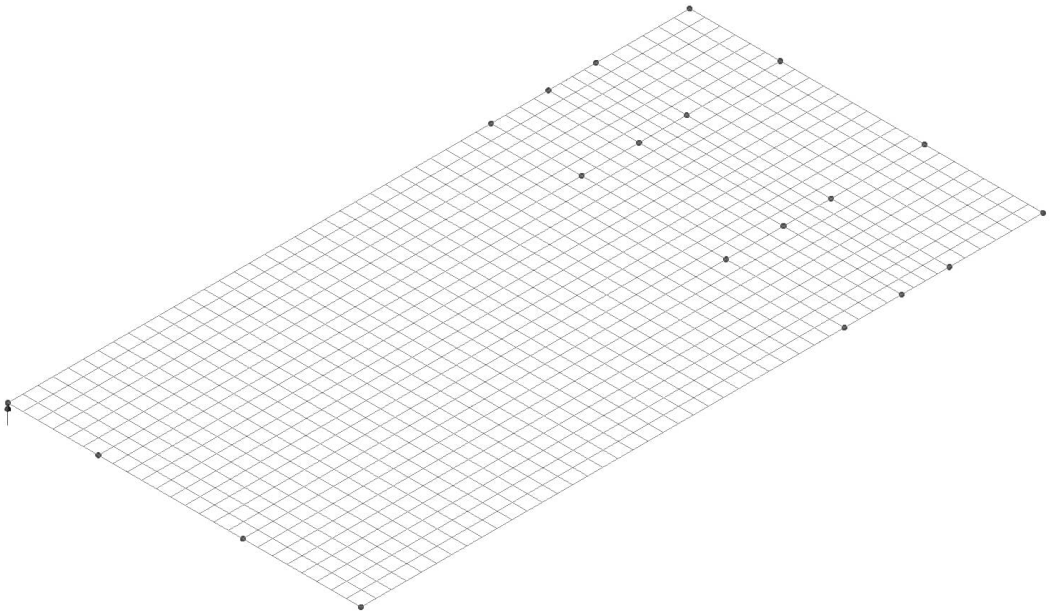
2.5.1.4 Boundary at foundation of wall 2/4 : “Line support wall 1/3:free”



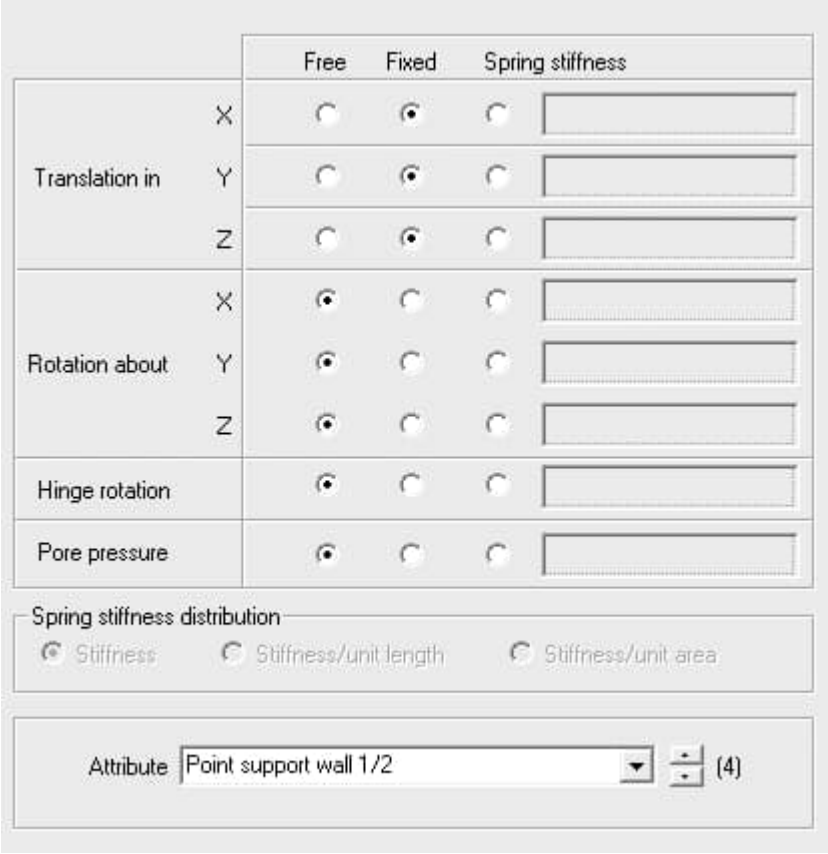


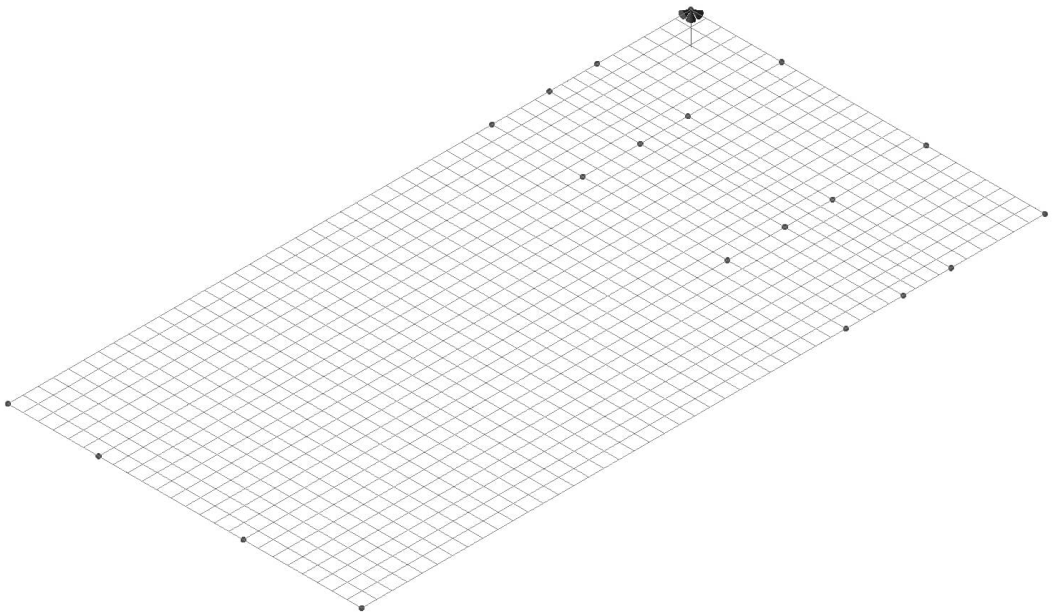
2.5.1.5 Boundary at foundation of wall 1/4 : “Point support wall 1/4”



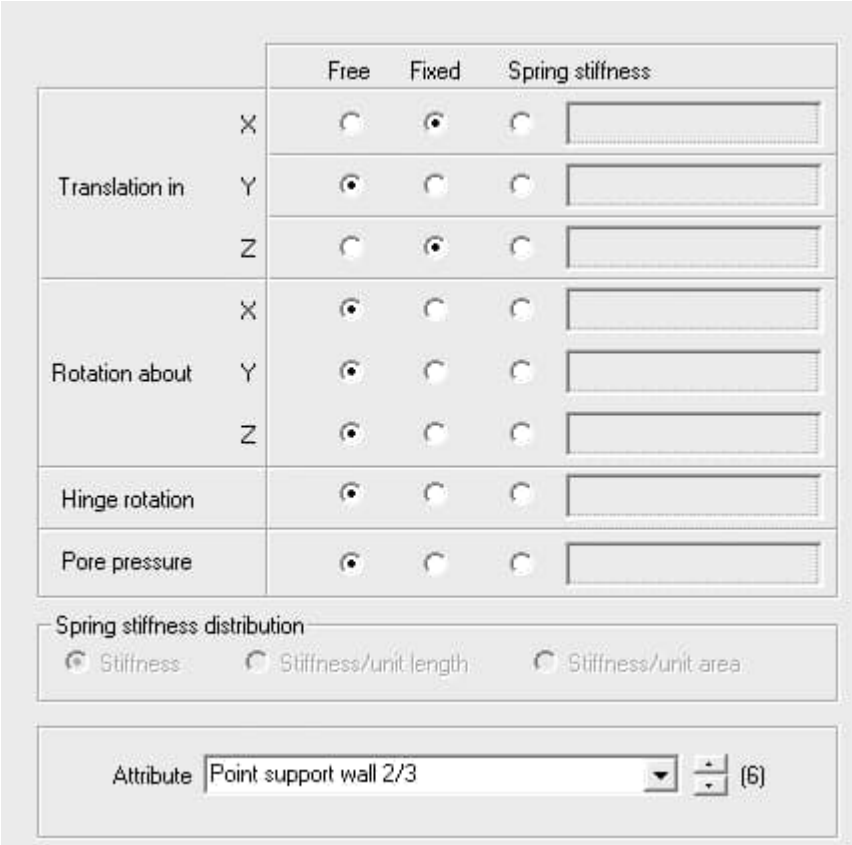


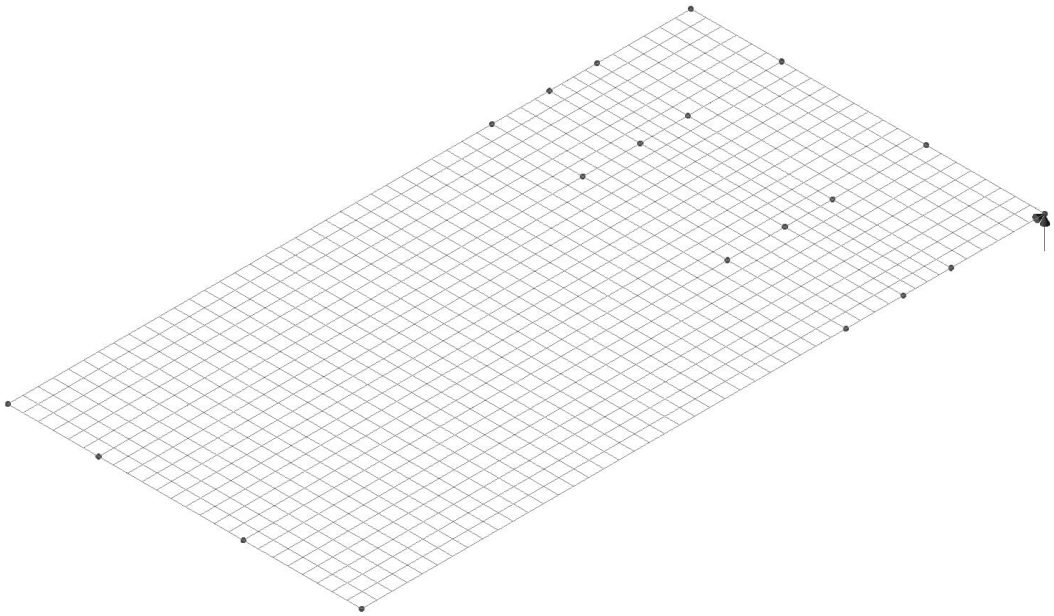
2.5.1.6 Boundary at foundation of wall 1/2 : “Point support wall 1/2”



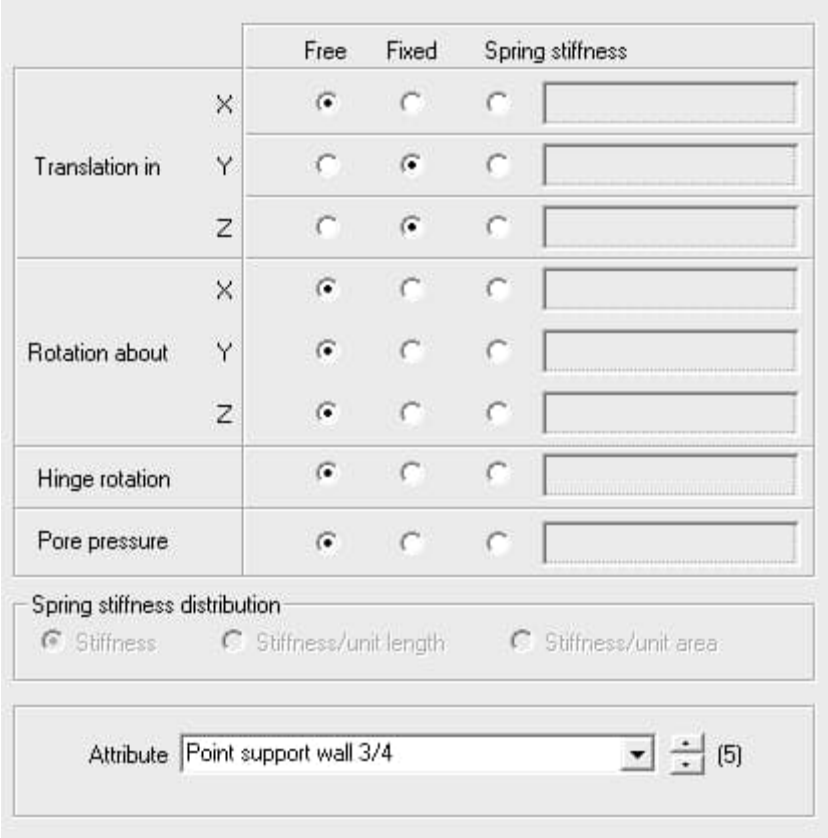


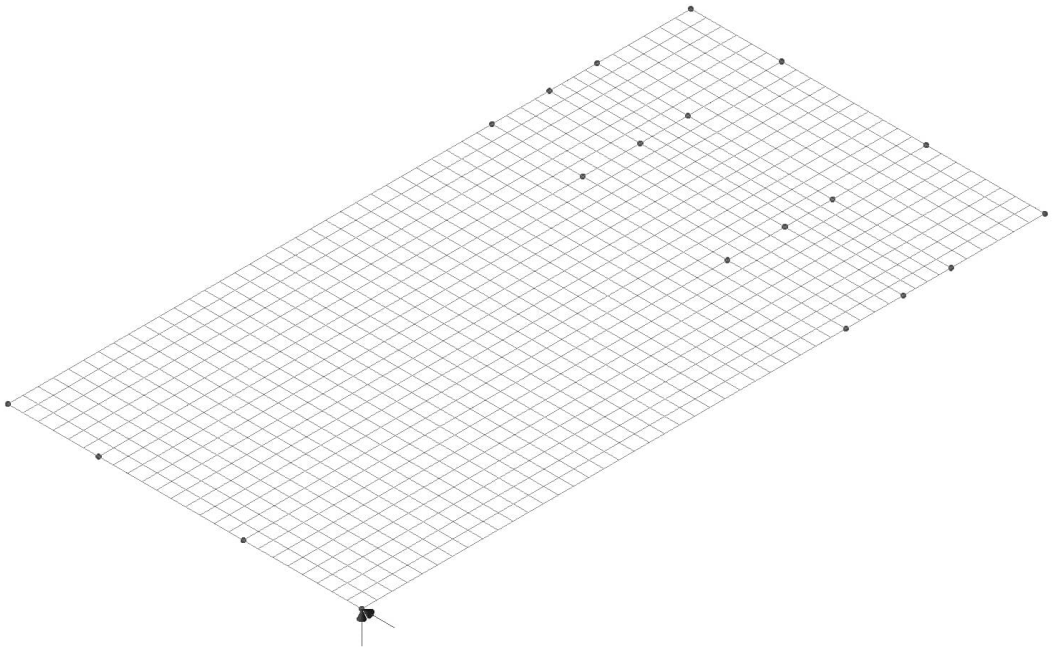
2.5.1.7 Boundary at foundation of wall 2/3 : “Point support wall 2/3”





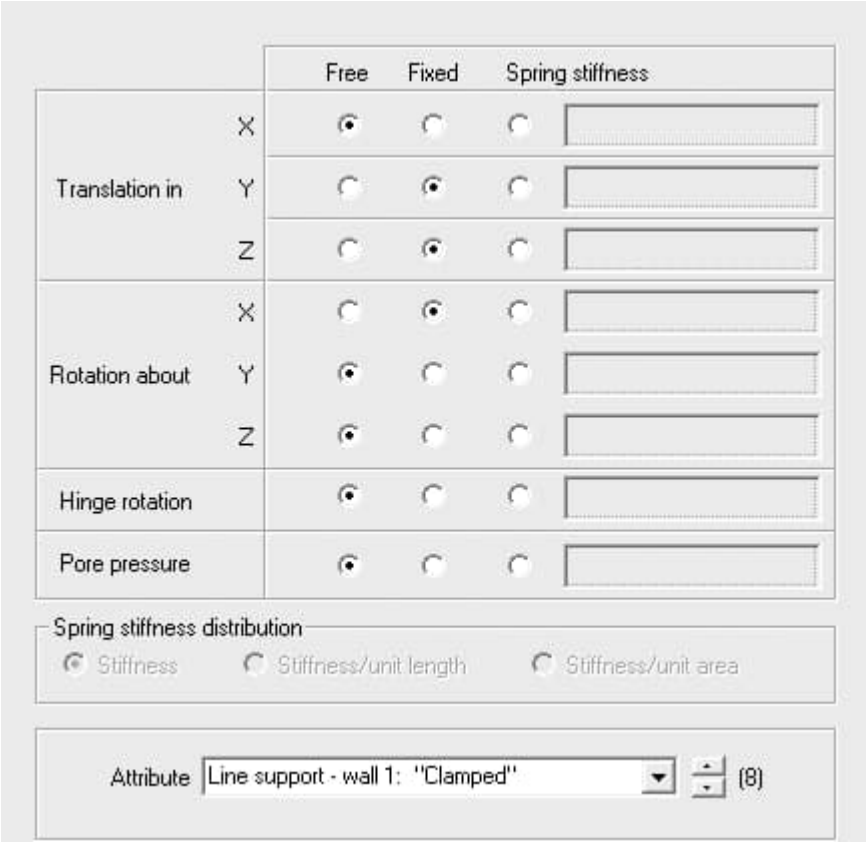
2.5.1.8 Boundary at foundation of wall 3/4 : “Point support wall 3/4”

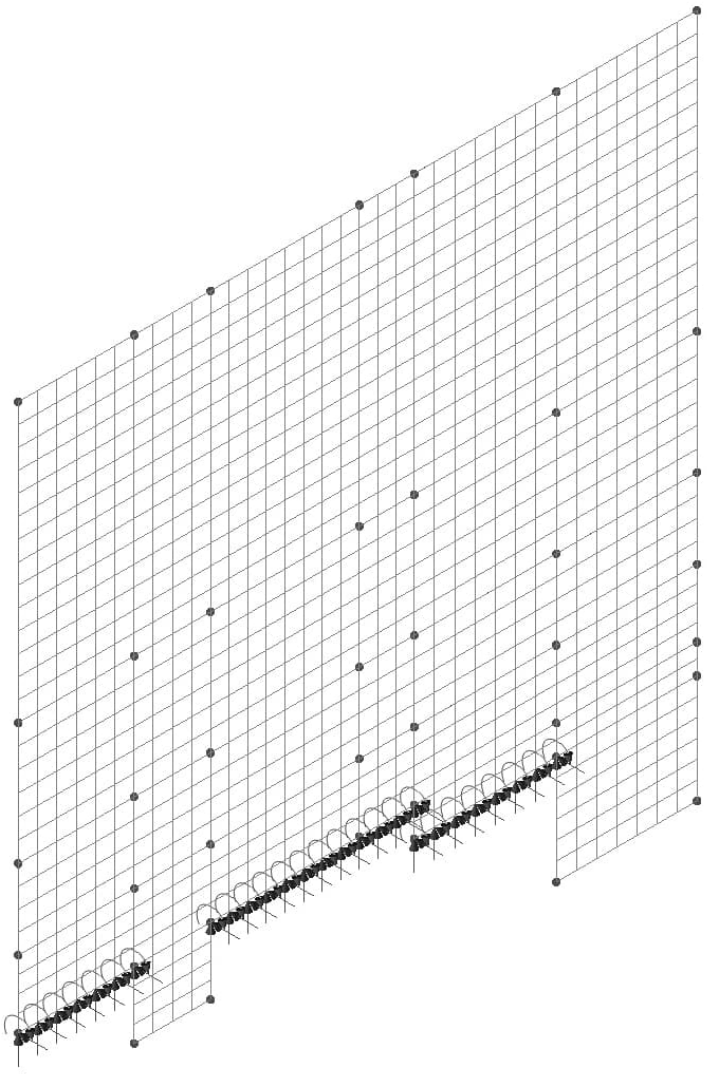




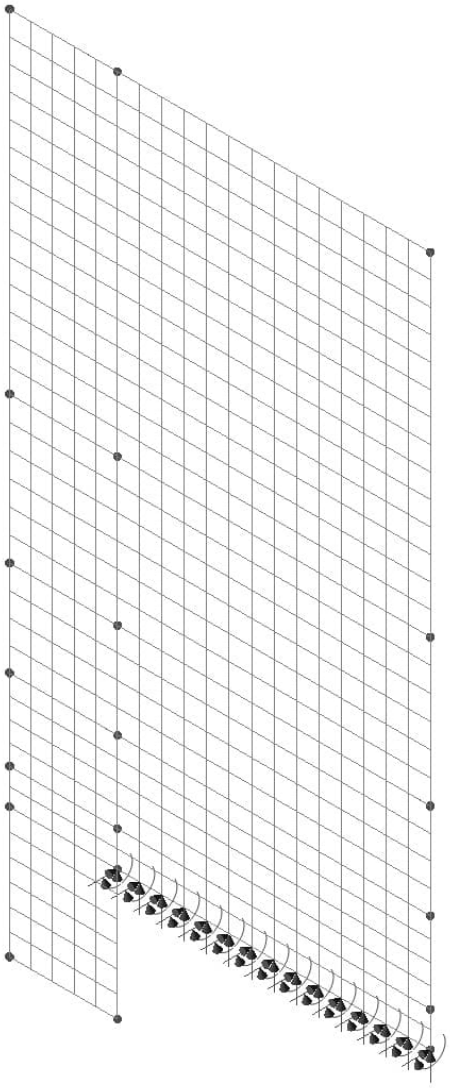
2.5.2 Model : Part II (Walls)

2.5.2.1 Boundary at foundation of wall 1 : “Line support – wall 1: Clamped”

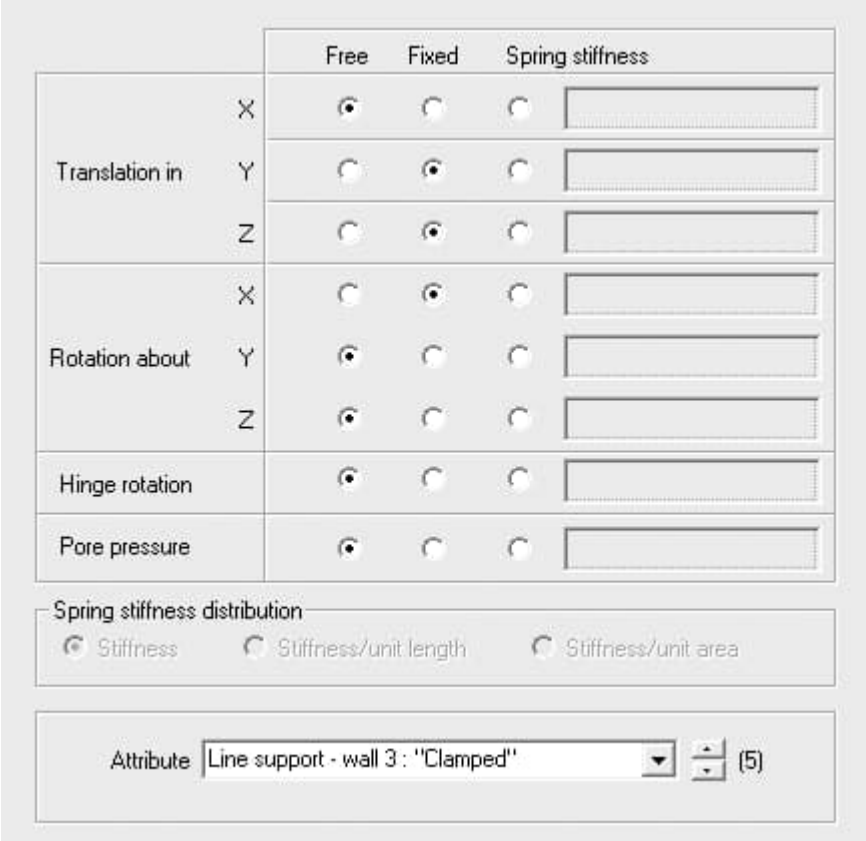


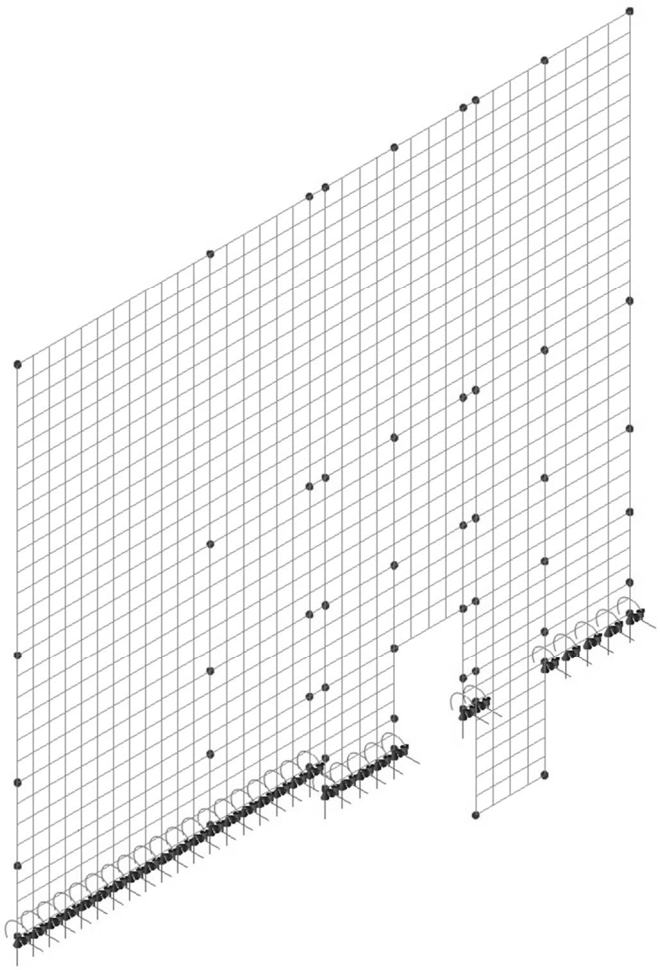


2.5.2.2 Boundary at foundation of wall 2 : “Line support – wall 2: Clamped”

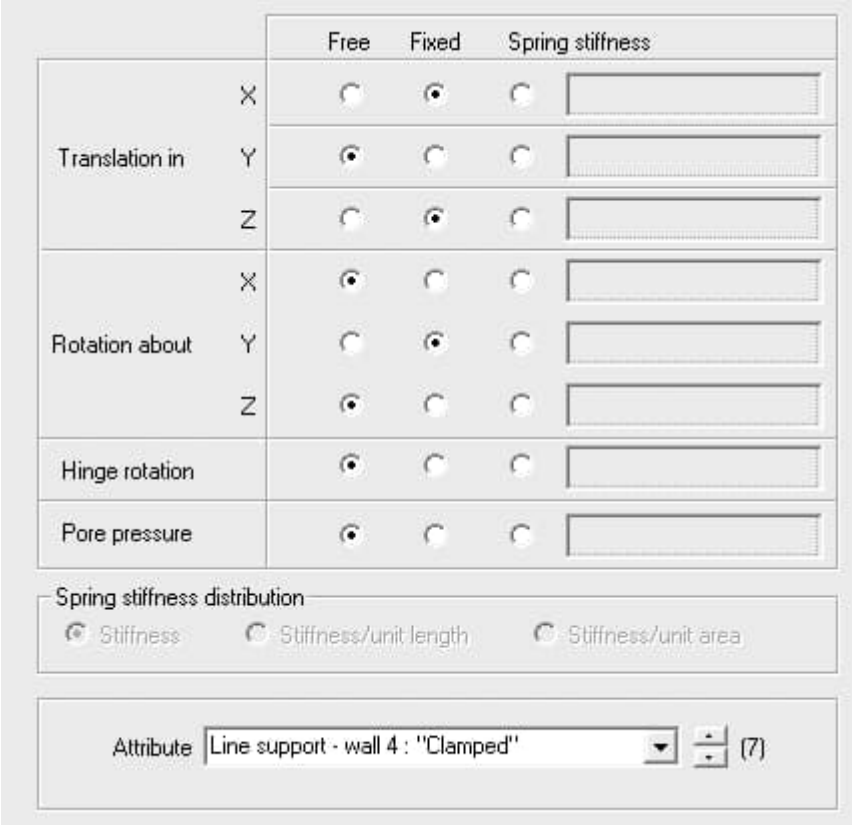


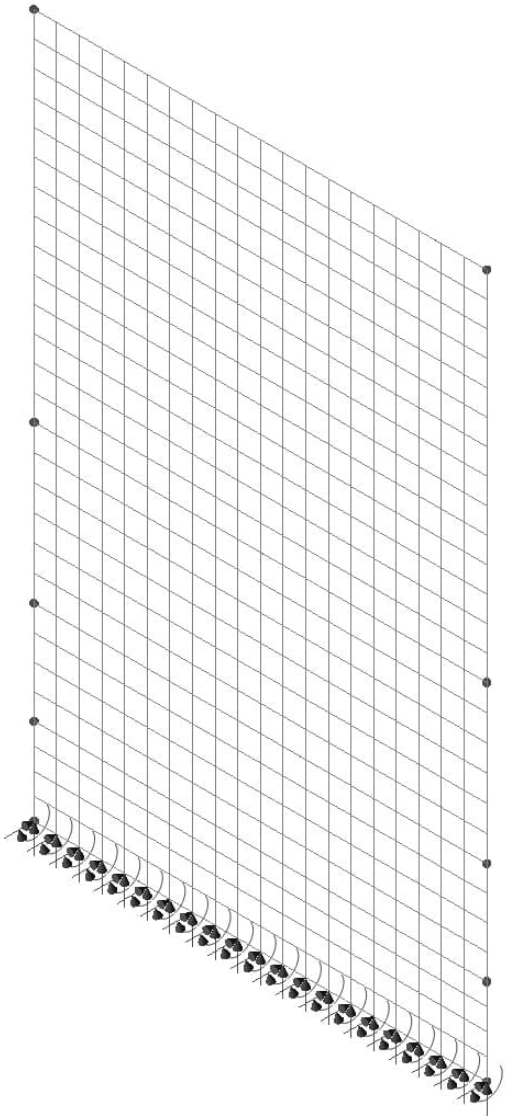
2.5.2.3 Boundary at foundation of wall 3 : “Line support – wall 3 : Clamped”





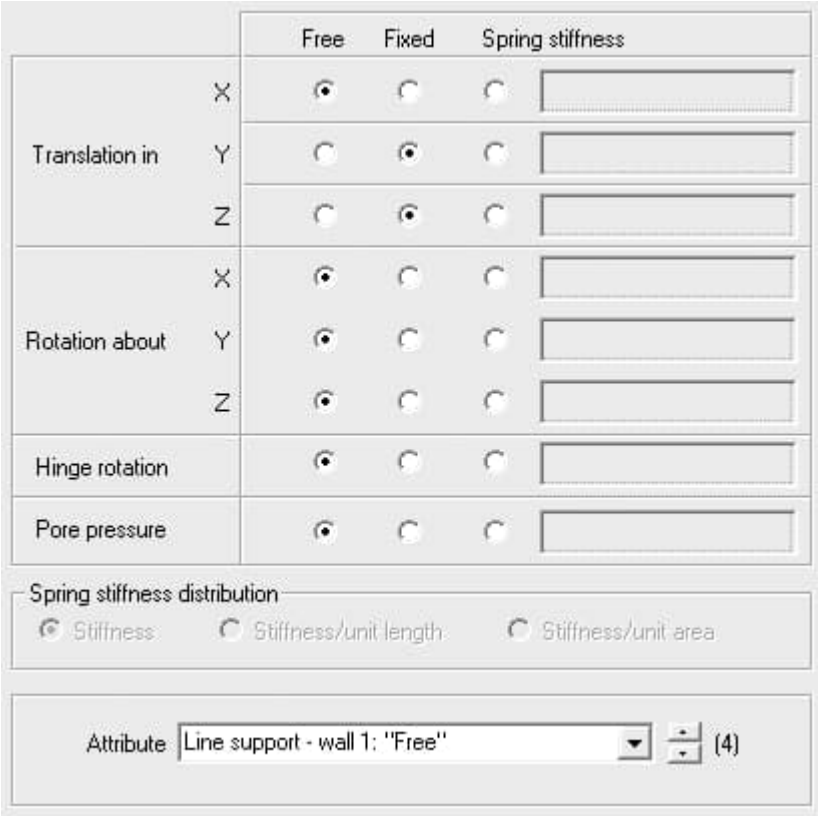
2.5.2.4 Boundary at foundation of wall 4 : “Line support – wall 4 : Clamped”

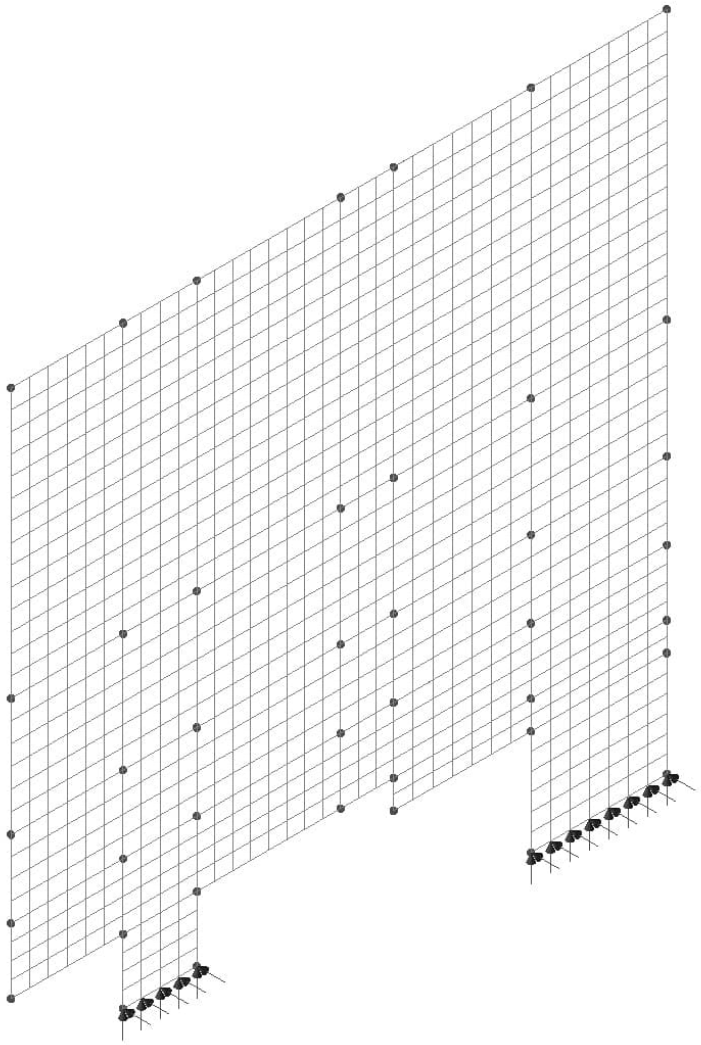




2.5.2.5 Boundary at foundation of wall 1 : “Line support – wall 1 : Free”

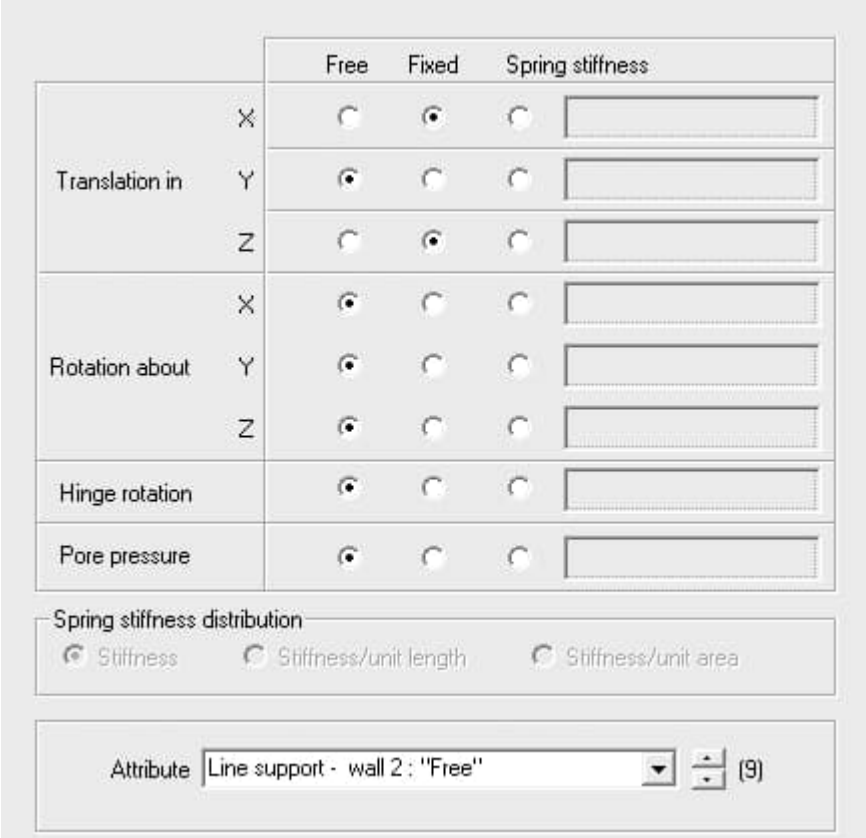
Simulates horizontal boundary conditions at pits.

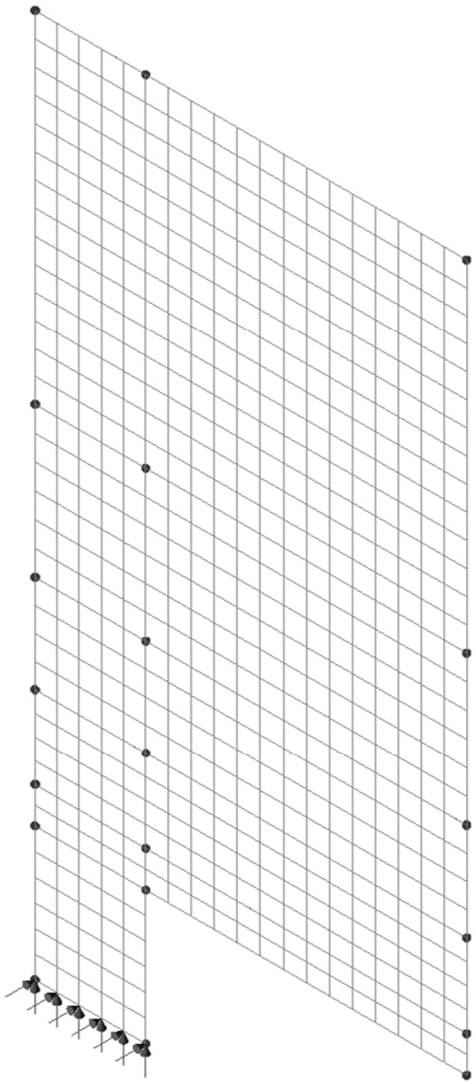




2.5.2.6 Boundary at foundation of wall 2 : “Line support – wall 2 : Free”

Simulates horizontal boundary conditions at pits.



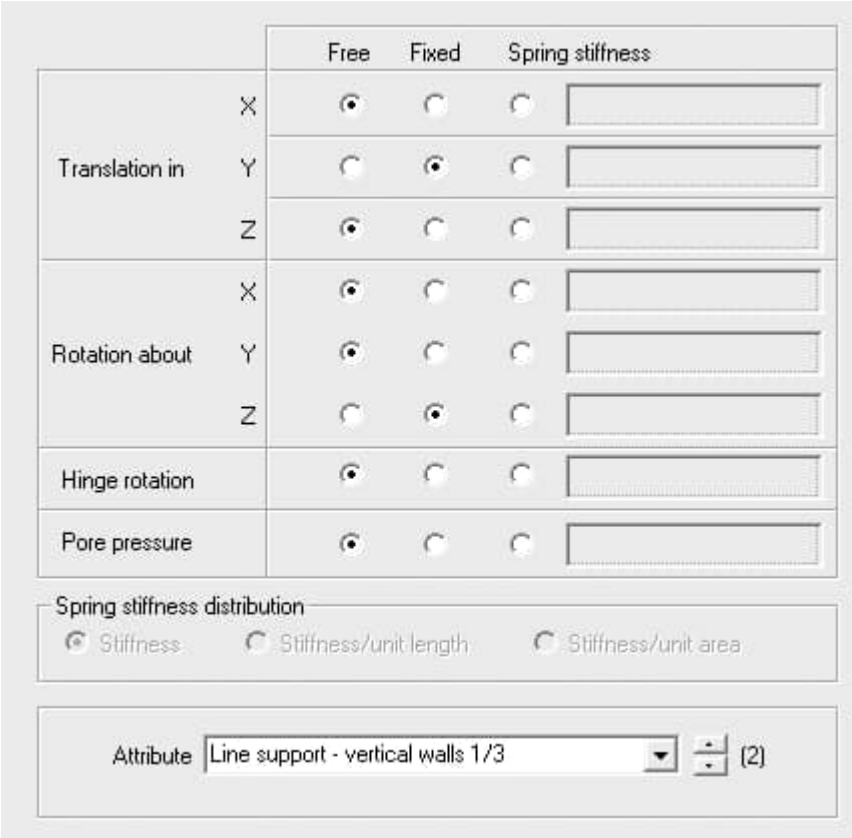


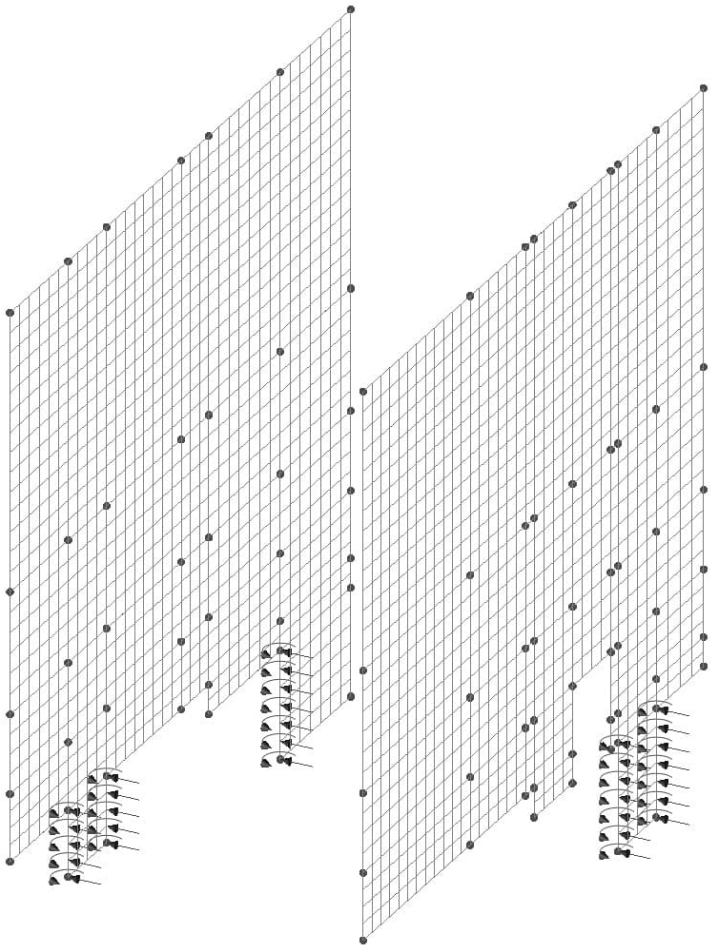
2.5.2.7 Boundary at foundation of wall 2 : “Line support – wall 2 : Free”

Simulates horizontal boundary conditions at pits.

2.5.2.8 Boundary at foundation of wall 1/3 : “Line support vertical 1/3”

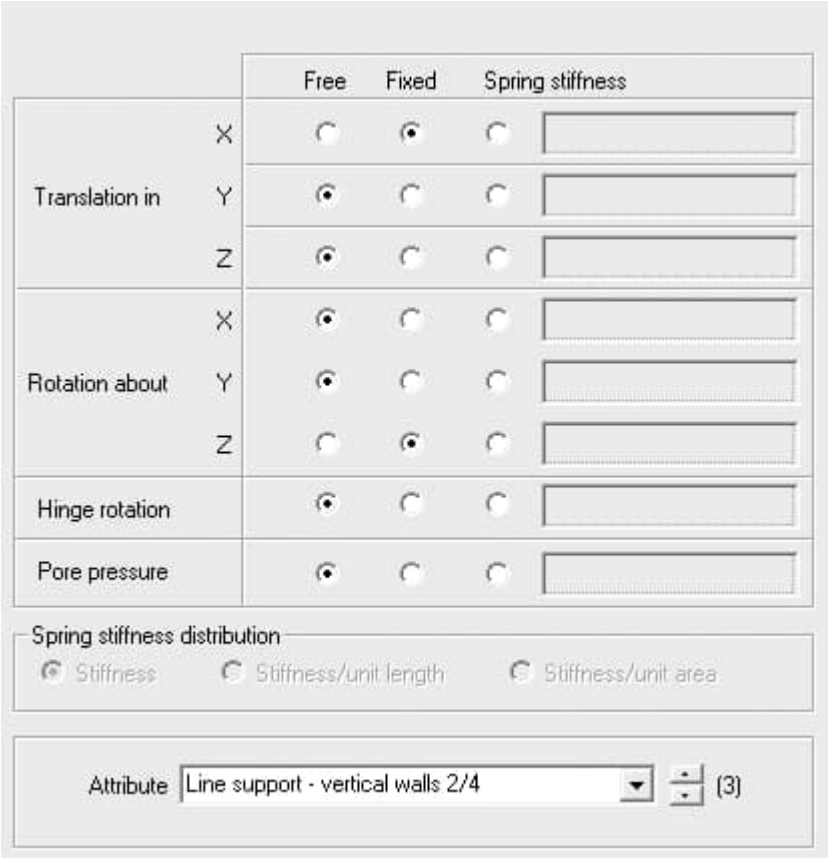
Simulates horizontal boundary conditions at pits.

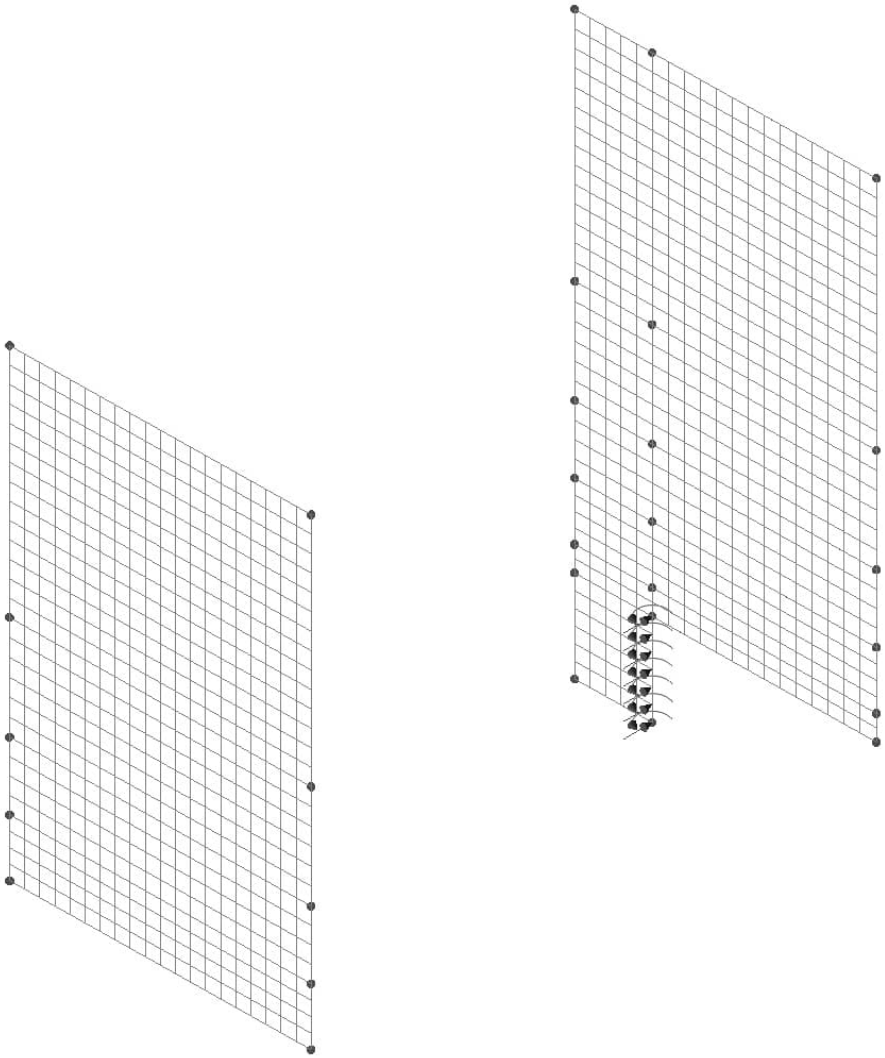




2.5.2.9 Boundary at foundation of wall 2/4 : “Line support vertical 2/4”

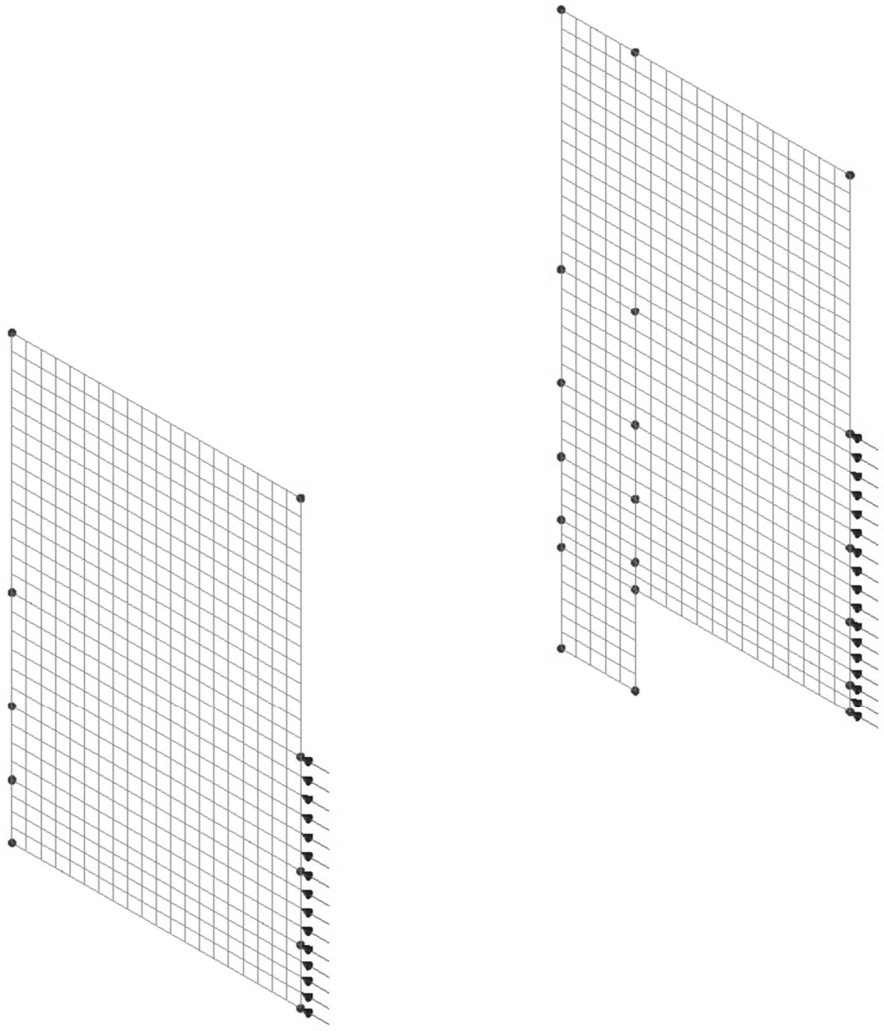
Simulates horizontal boundary conditions at pits.





2.5.2.10 Boundary at foundation of wall 2/4 : “Line support horizontal 2/4”

Simulates edge beams acting between level +67.0 and to +81.0 along base line1 and base line 4.

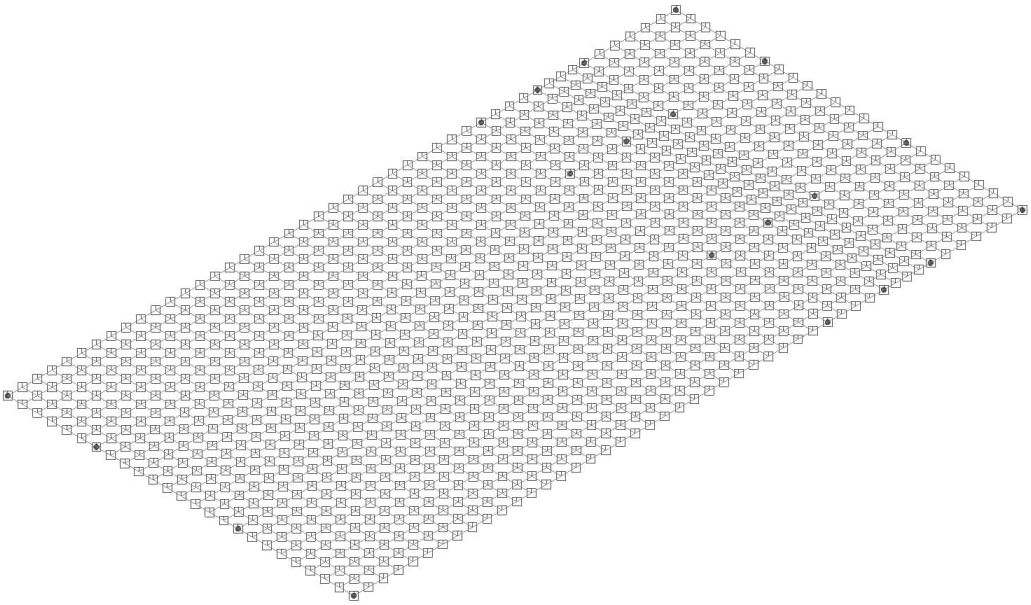


2.6 SEARCH AREA

Discrete loads are applied to various load areas. These are termed *Search Area*.

2.6.1 Model : Part I (Bottom slab)

For the analysis 1 *Search Area´*s are defined consisting om structural elements.

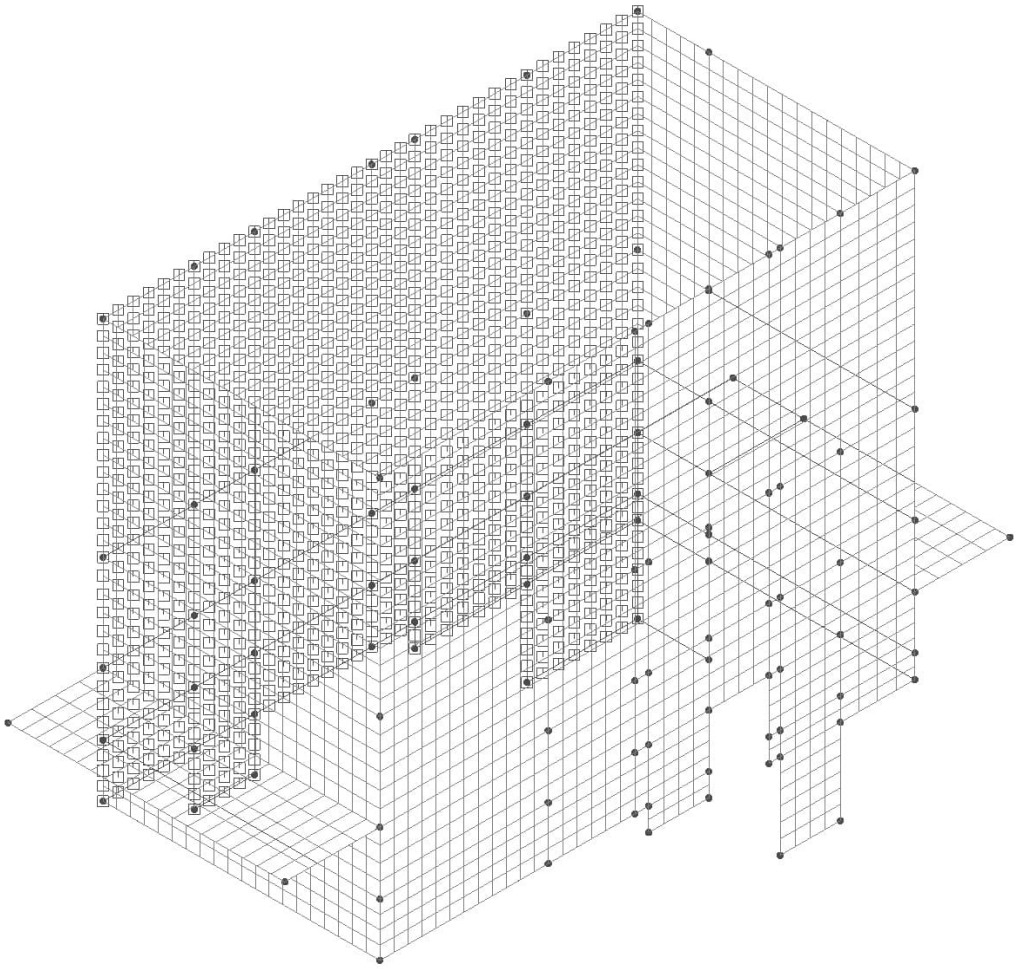


2.6.2 Model : Part II (Walls)

For the analysis 4 *Search Area´*s are defined consisting om structural elements.

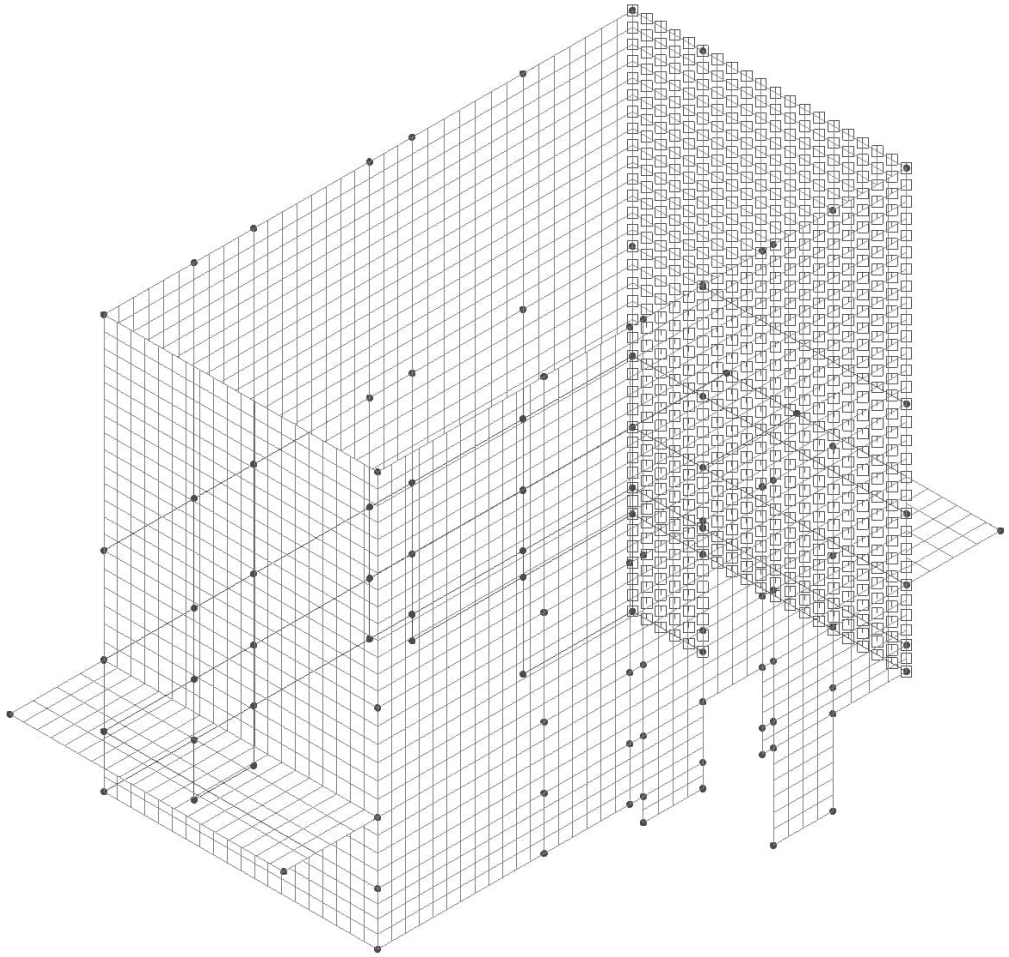
2.6.2.1 *Search* area : *Wall 1*

Structural elements : Wall 1



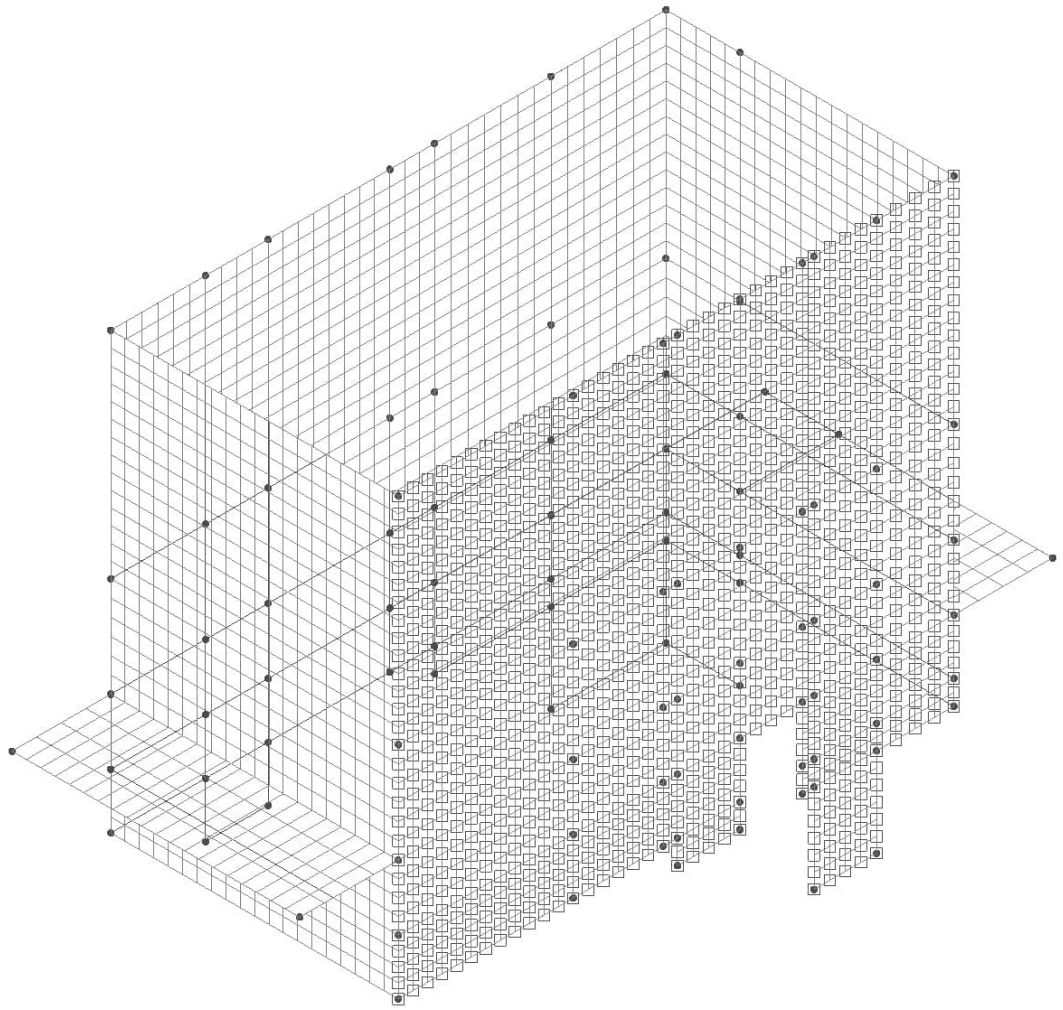
2.6.2.2 *Search* area : *Wall 2*

Structural elements : Wall 2



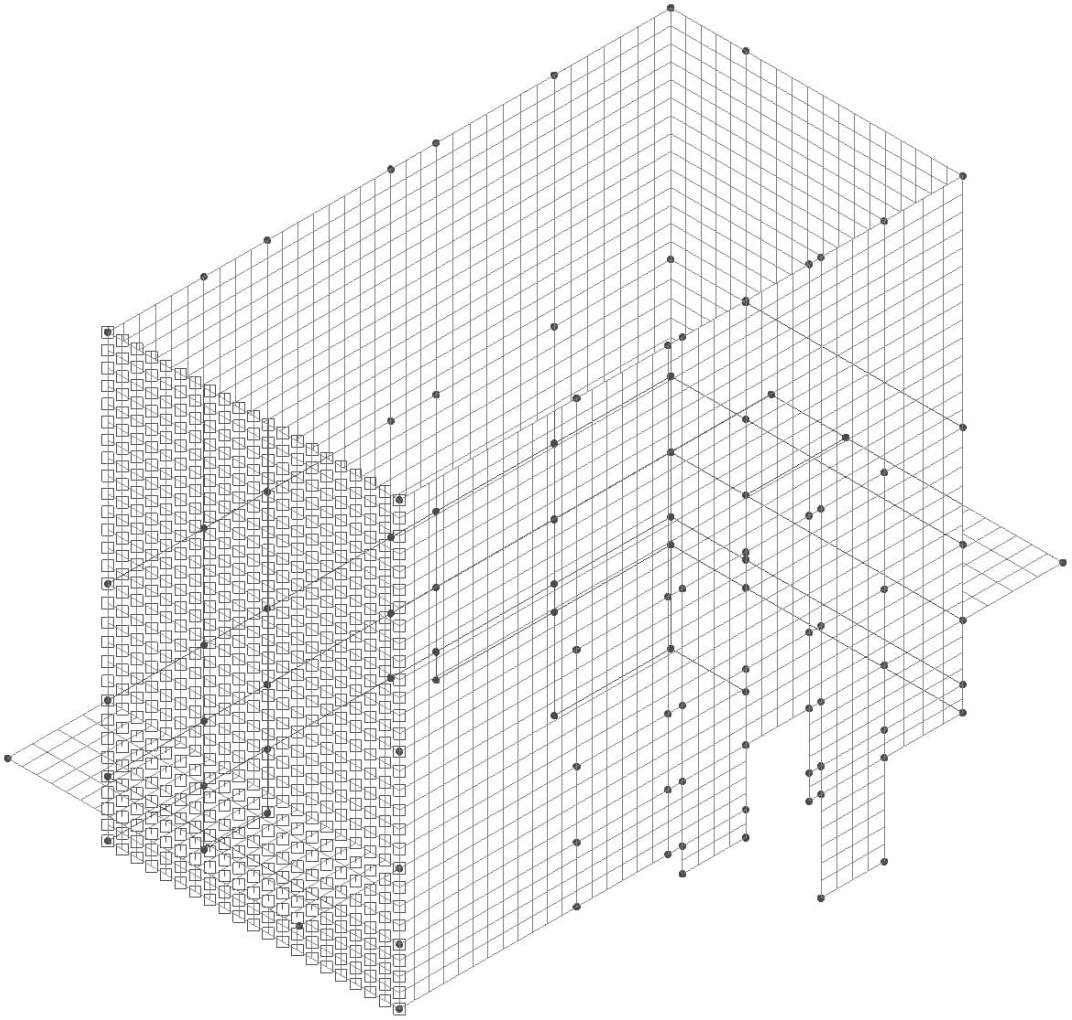
2.6.2.3 *Search* area : *Wall 3*

Structural elements : Wall 3



2.6.2.4 *Search* area : *Wall 4*

Structural elements : Wall 4



3. LOADS

Remark This section describes load effect of Model: Part II (Walls).

Loads applied to Model :Part I (Slab) consists of ground pressure and is described separately in chapter C.

3.1 DEAD WEIGHT (DC)

3.1.1 Reinforced concrete (DC 1)

$\gamma_c = 24 \ \frac{kN}{m^3}$

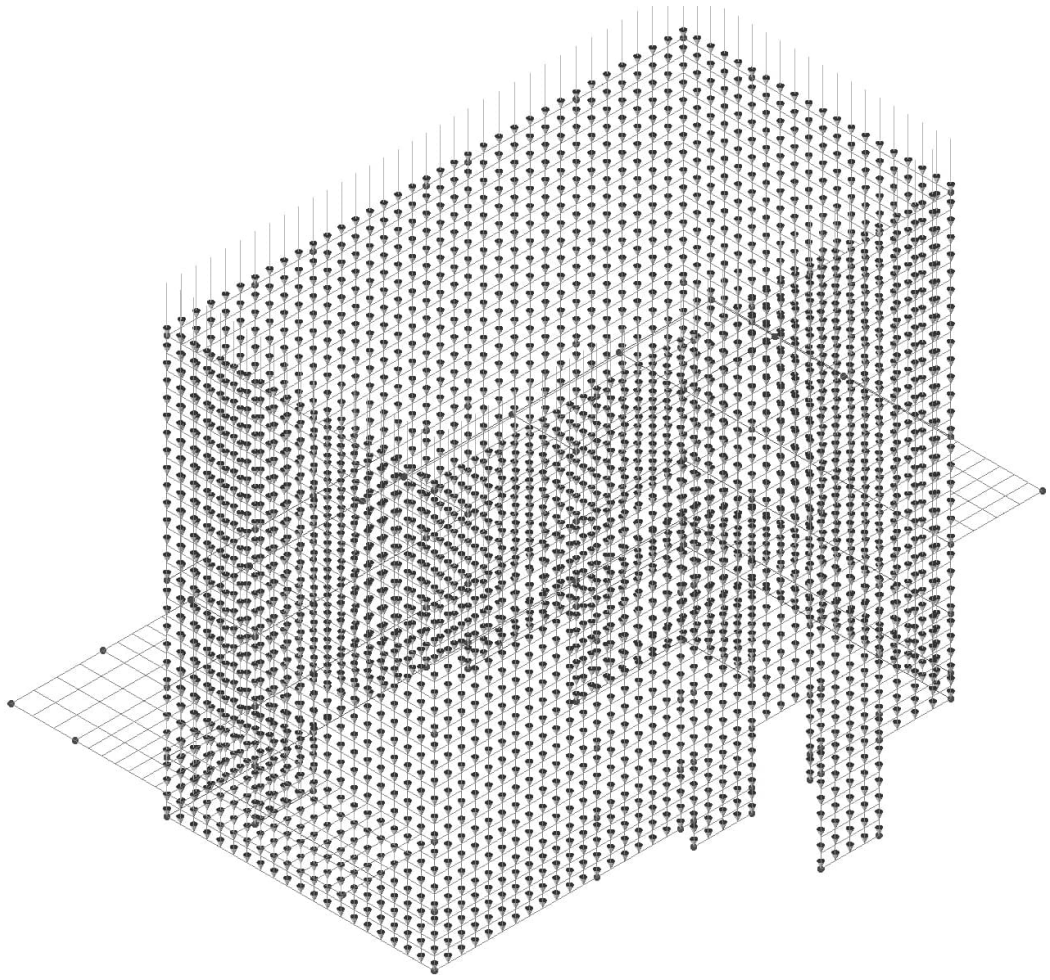
Loadcase : DC 1

Structural loading : Body force

Acceleration in z direction (a_z) : -10 $\frac{m}{s^2}$

Component	Value
Linear acceleration in X	0,0
Linear acceleration in Y	0,0
Linear acceleration in Z	-10,0
Angular velocity about X axis	0,0
Angular velocity about Y axis	0,0
Angular velocity about Z axis	0,0
Angular acceleration about X axis	0,0
Angular acceleration about Y axis	0,0
Angular acceleration about Z axis	0,0

Attribute DC 1 (3)



Shell elements : $q = a_z \cdot t \cdot \rho_c$

Remark Load intensity is found by applying density and geometric properties to all SURFACES. Load on slabs at level +77.0 is not included.

3.1.2 Roof structure (DC 2)

The loadcase includes roof (equivalent load 1 kPa) and upper wall (level > 90.11).

The load intensity of roof is distributed along concrete walls at level +90.11.

Roof :

$A_{roof} = 23.7m \cdot 13.0m = 310m^2$: area of roof

$P_{roof.1} = 310m^2 \cdot 1kPa = 308kN$

Upper wall :

$l_{wall} = 2 \cdot (23.7m + 13.0m) = 73m$: length of upper wall

$t_{wall} = 0.3m$: thickness of upper wall

$h_{wall} = 1.5m$: height of upper wall

$P_{roof.2} = 73m \cdot 0.3m \cdot 1.5m \cdot 24\frac{kN}{m^3} = 790kN$

Total :

$P_{roof} = 310kN + 790kN = 1100kN$

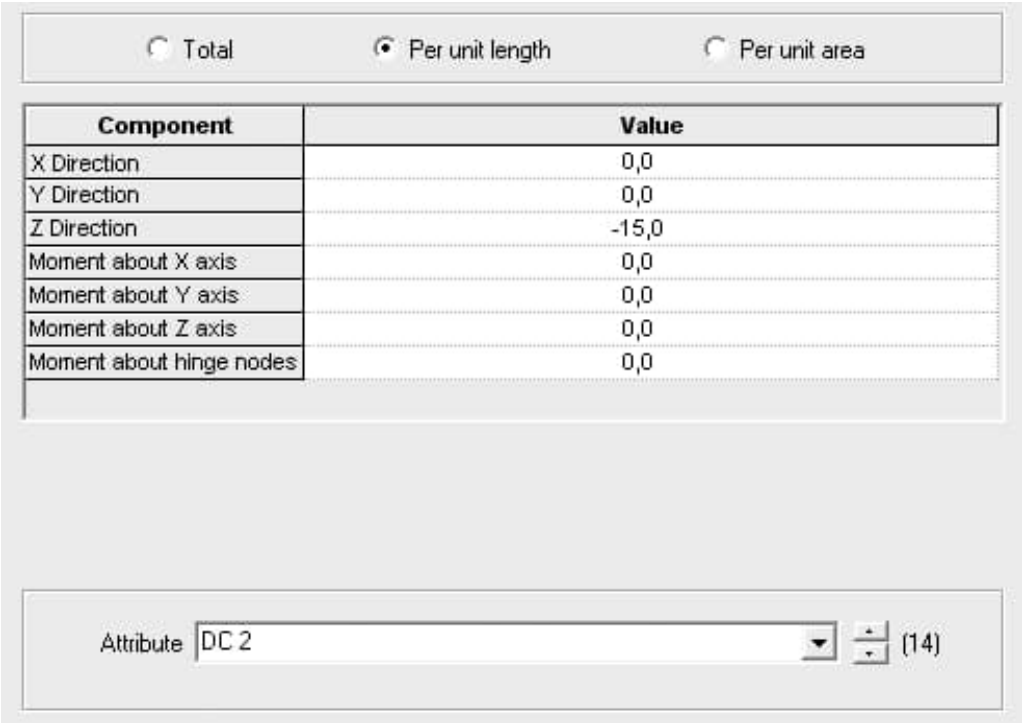
$p_{roof} = \frac{P_{roof}}{l_{wall}} = \frac{1100kN}{73m} = 15\frac{kN}{m}$

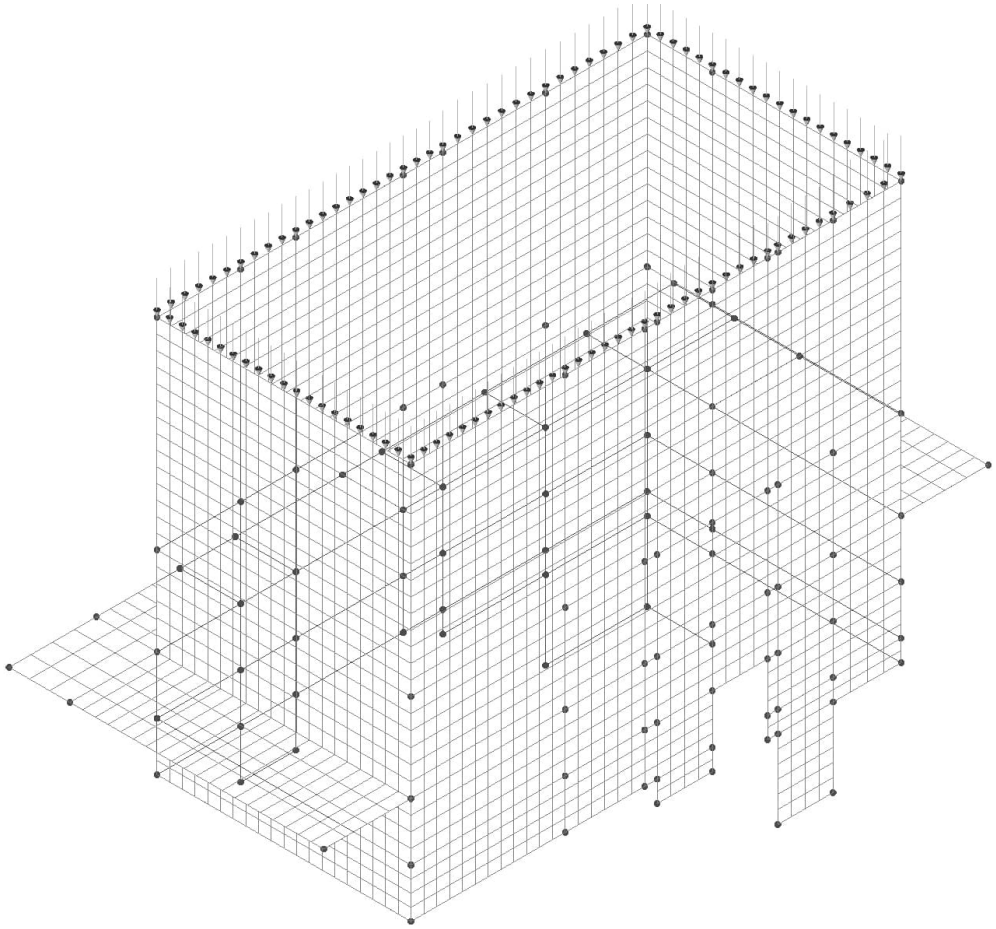
Loadcase : DC 2

Structural loading : Global distributed

Force type : Per unit length

Component z direction : -15 $\frac{kN}{m}$





3.1.3 Earth filling

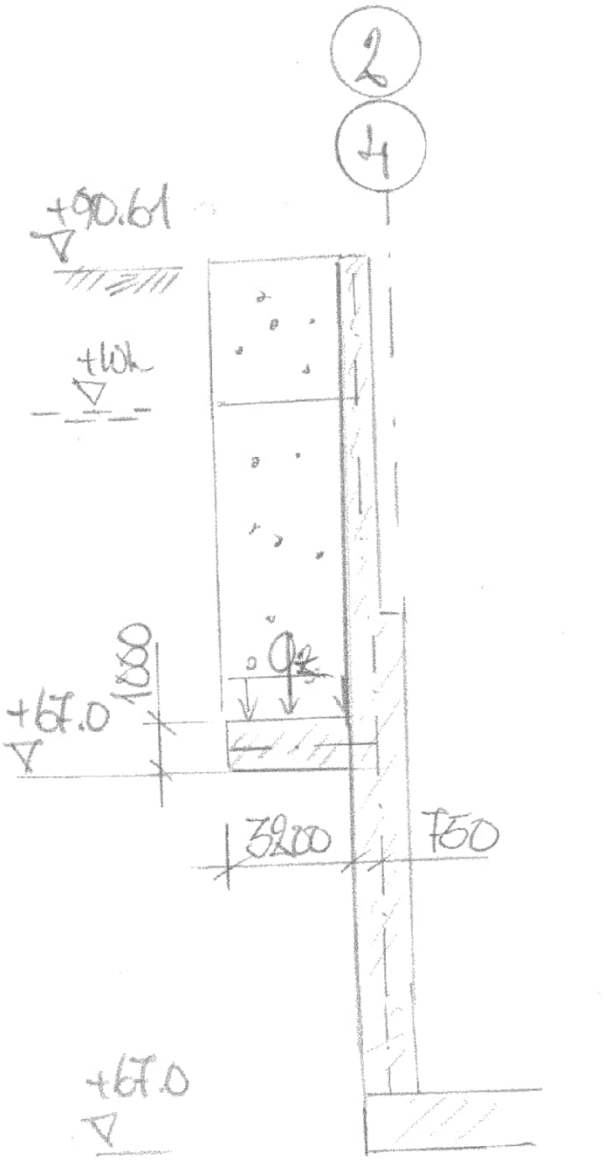
Load is introduced at level +77.50 due the effect of horizontal slab along base line 2, 4 and A. The effect of these parts is studied at levels H0, H1, H2 and H3.

Densities :

$\gamma_e = 18 \frac{kN}{m^3}$; $\gamma'_e = 11 \frac{kN}{m^3}$ - Earth filling

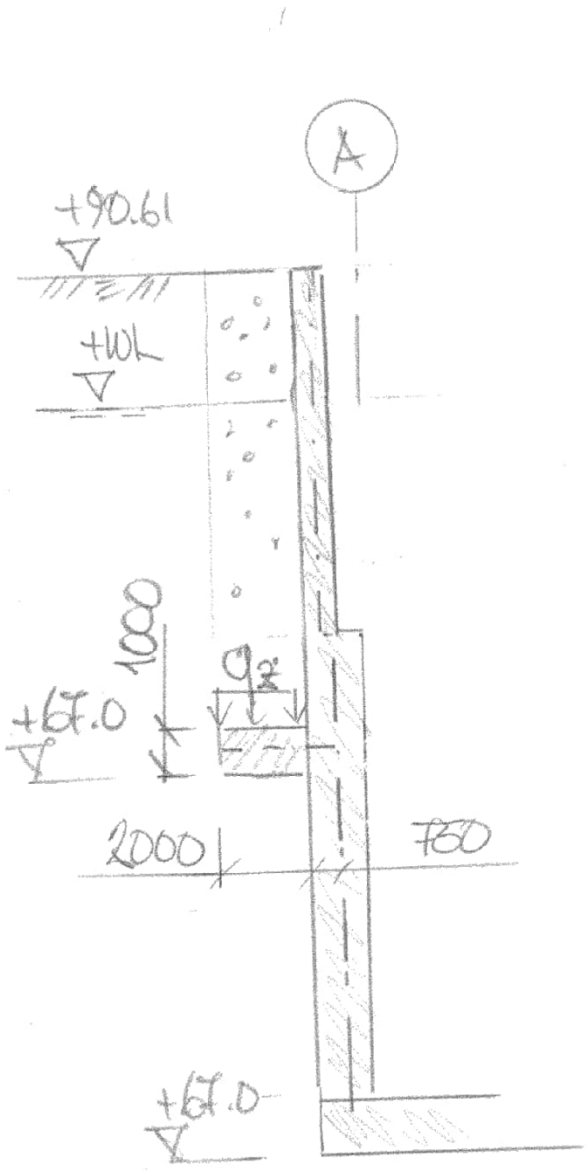
$\gamma_c = 24 \frac{kN}{m^3}$; $\gamma'_c = 14 \frac{kN}{m^3}$ - Concrete

Load on wall 2:2 and 4:2 :



Fictious loadarea : $A'_{tot} = (3.2m + 0.75m) \cdot 11.5m = 45.4m^2$

Load on wall 1:4 :



Fictious loadarea : $A'_{tot} = (2.0m + 0.75m) \cdot 30.1m = 82.8m^2$

3.1.3.1 Water level H0

Water level H0 : WL = +67.0

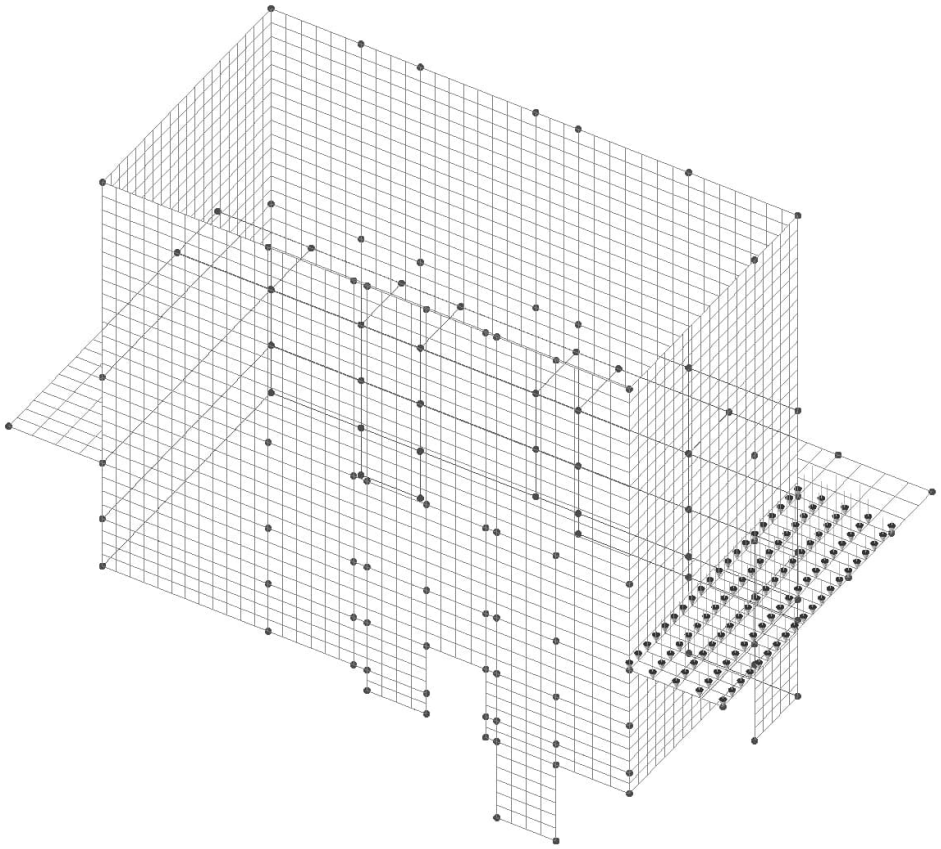
Load on Wall 2:2 (Load case DC 3_1 – H0)

- Concrete : $P_{wall} = \gamma_c \cdot b \cdot l = 24\frac{kN}{m^3} \cdot 3.2m \cdot 11.5m \cdot 1.0m = 883kN$

- Earth filling : $P_{earth} = (90.61m - 78.00m) \cdot 18\frac{kN}{m^3} \cdot 3.2m \cdot 11.5m = 8352kN$

$$\Rightarrow \qquad P_{total} = 9236kN$$

$$q_z = \frac{P_{total}}{A_{total}} = \frac{9236kN}{45.4m^2} = 203kPa$$



Loadcase : DC 3_1 – H0

Structural loading : Global distributed

Force type : Per unit area

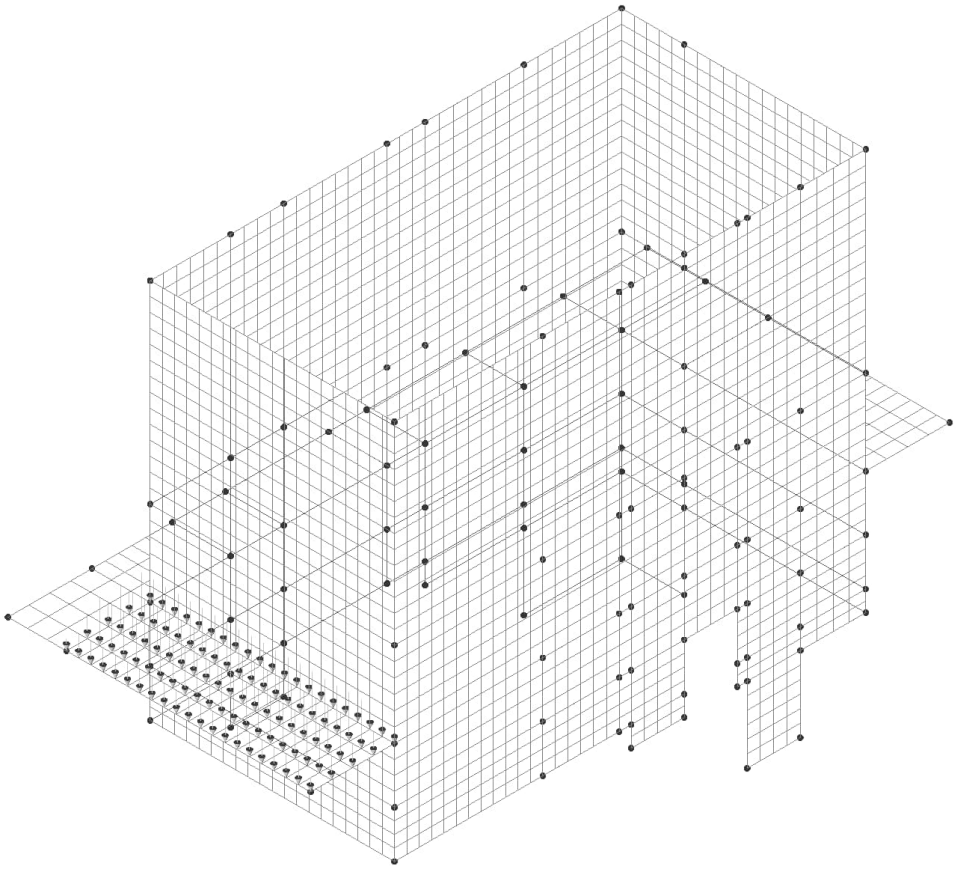
Load on Wall 4:2 (Load case DC 3_2 – H0)

• Concrete : $P_{wall} = \gamma_c \cdot b \cdot l = 24\frac{kN}{m^3} \cdot 3.2m \cdot 11.5m \cdot 1.0m = 883kN$

• Earth filling : $P_{earth} = (90.61m - 78.00m) \cdot 18\frac{kN}{m^3} \cdot 3.2m \cdot 11.5m = 8352kN$

$$\Rightarrow \qquad P_{total} = 9236kN$$

$$q_z = \frac{P_{total}}{A_{total}} = \frac{9236kN}{45.4m^2} = 203kPa$$

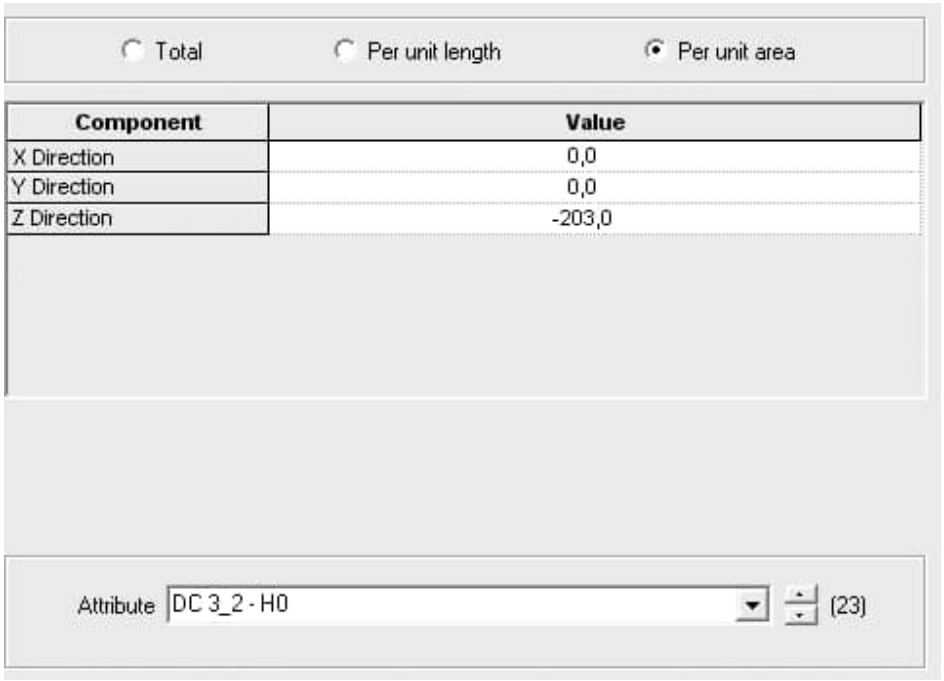


Loadcase : DC 3_2 – H0

Structural loading : Global distributed

Force type : Per unit area

Component z direction : -203 $\frac{kN}{m^2}$



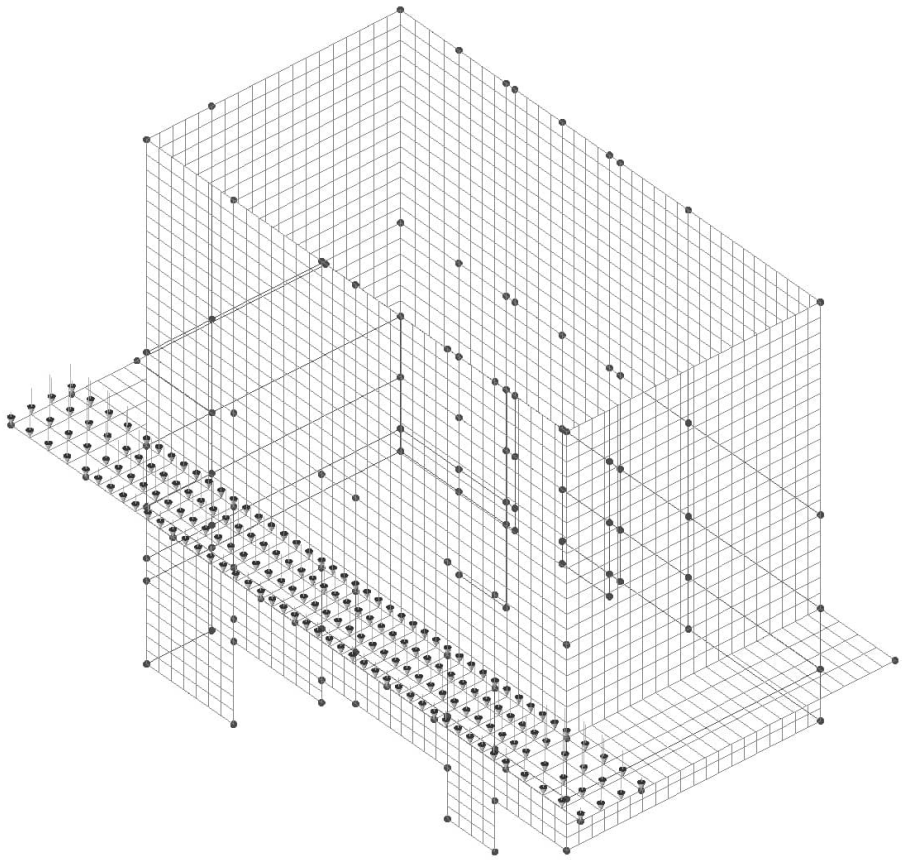
Load on Wall 1:4 (Load case DC 3_3 – H0)

- Concrete : $P_{wall} = \gamma_c \cdot b \cdot l = 24\frac{kN}{m^3} \cdot 2.0m \cdot 30.1m \cdot 1.0m = 1448kN$

- Earth filling : $P_{earth} = (90.61m - 78.00m) \cdot 18\frac{kN}{m^3} \cdot 2.0m \cdot 30.1m = 13364kN$

$$\Rightarrow \qquad P_{total} = 14812kN$$

$$q_z = \frac{P_{total}}{A_{total}} = \frac{14812kN}{82.8m^2} = 178kPa$$

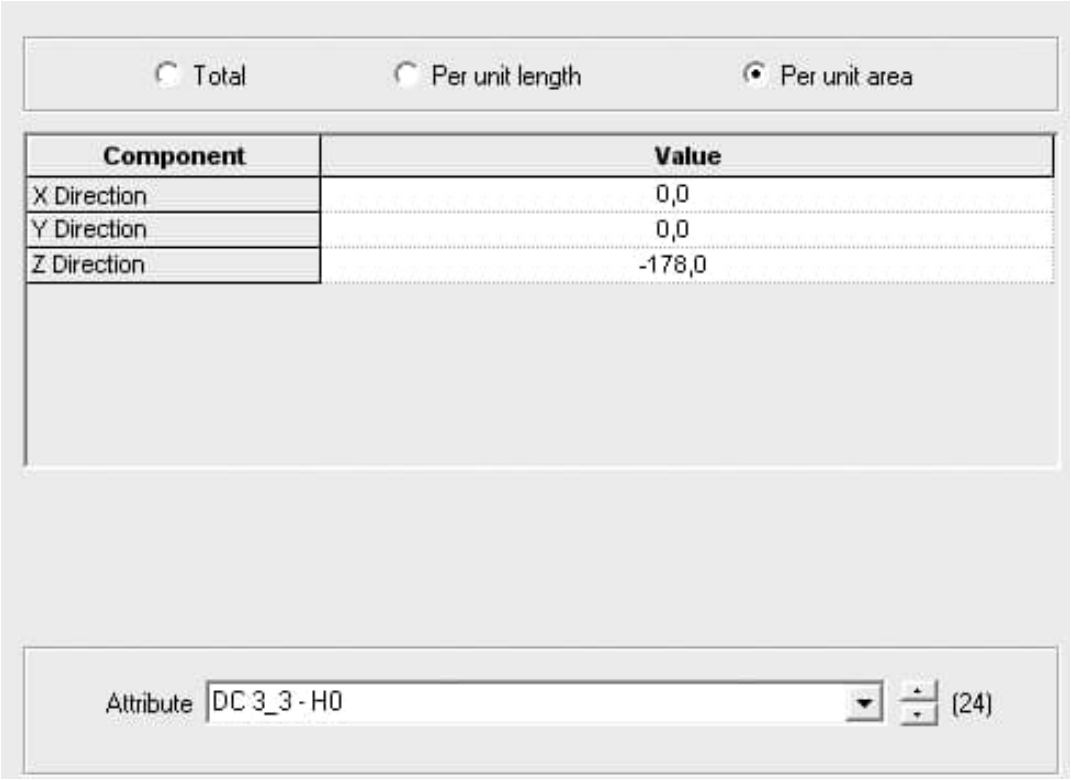


Loadcase : DC 3_3 – H0

Structural loading : Global distributed

Force type : Per unit area

Component z direction : -178 $\frac{kN}{m^2}$



3.1.3.2 Water level H1

Water level H1 : WL = +78.65

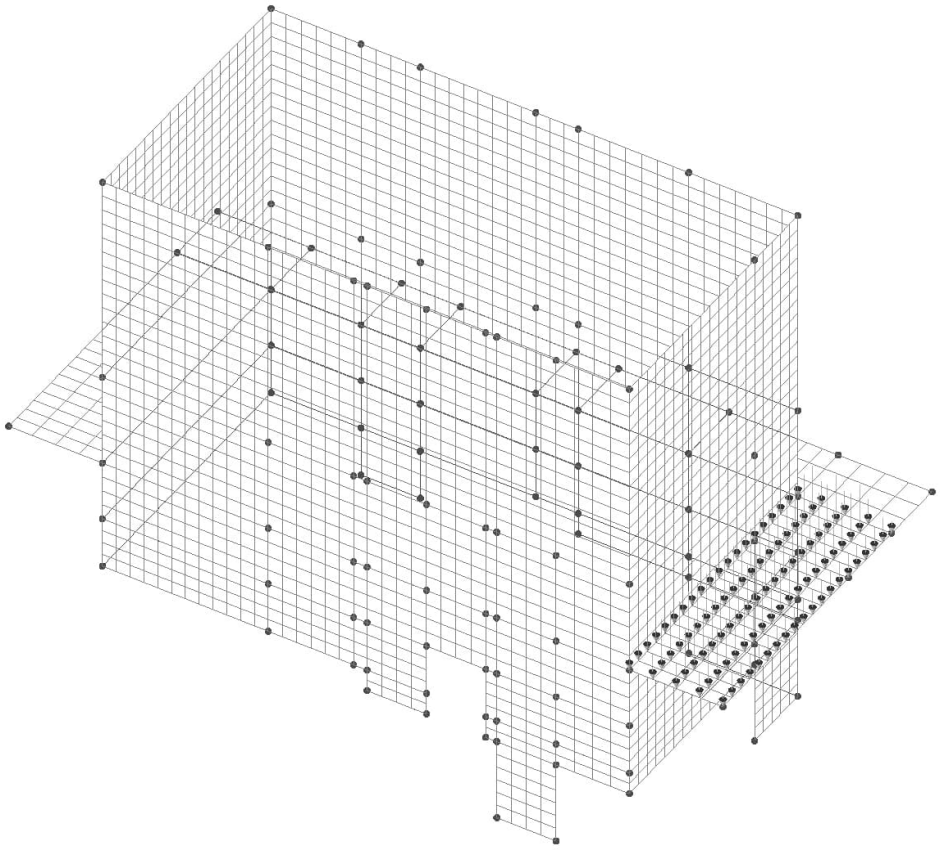
Load on Wall 2:2 (Load case DC 3_1 – H1)

• Concrete : $P_{wall} = \gamma'_c \cdot b \cdot l = 14\frac{kN}{m^3} \cdot 3.2m \cdot 11.5m \cdot 1.0m = 515kN$

• Earth filling : $P_{earth} = ((90.61m - 78.65m) \cdot 18\frac{kN}{m^3} + (78.65m - 78.00m) \cdot 11\frac{kN}{m^3}) \cdot 3.2m \cdot 11.5m = 8185kN$

$$\Rightarrow \qquad P_{total} = 9236kN$$

$$q_z = \frac{P_{total}}{A_{total}} = \frac{8700kN}{45.4m^2} = 192kPa$$



Loadcase : DC 3_1 – H1

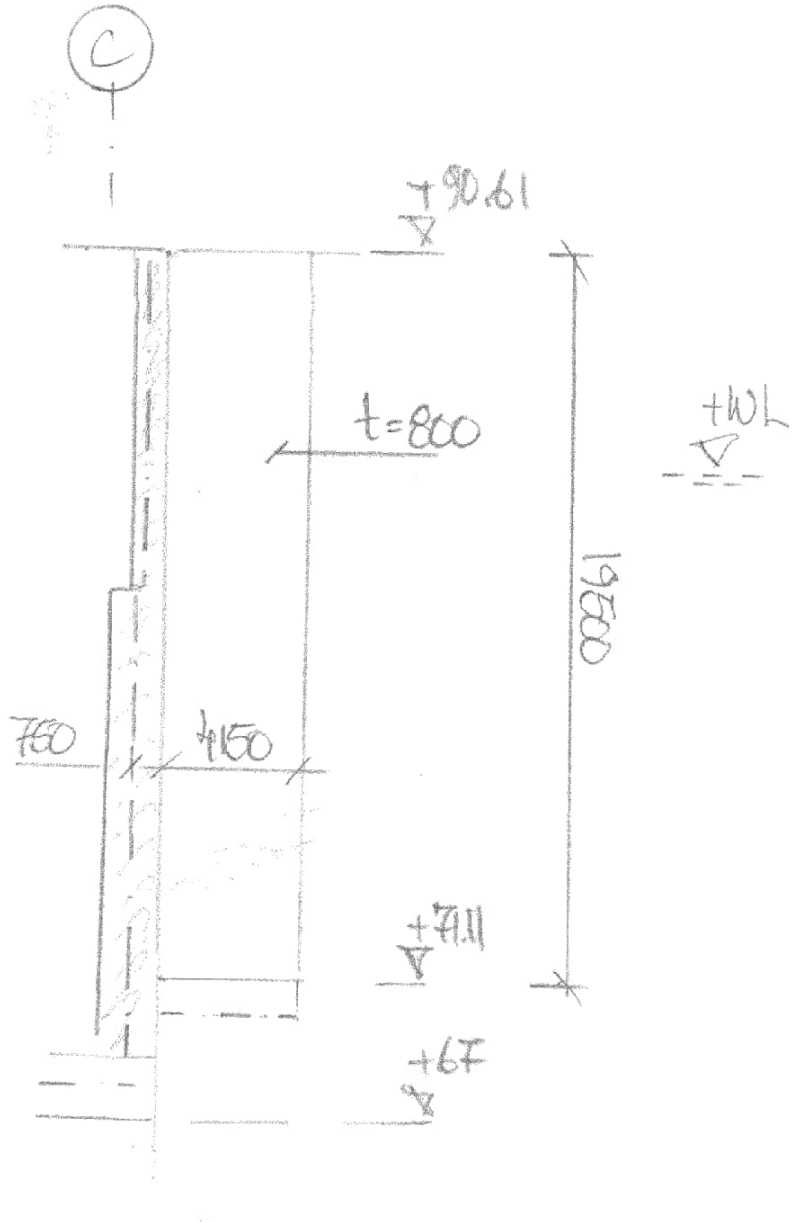
3.1.4 Concrete structure outside walls

The following parts describe load effect from parts Wall 3_4, Wall 3_5 and Wall 3_6.

The effect of these parts are studied at levels H0, H1, H2 and H3.



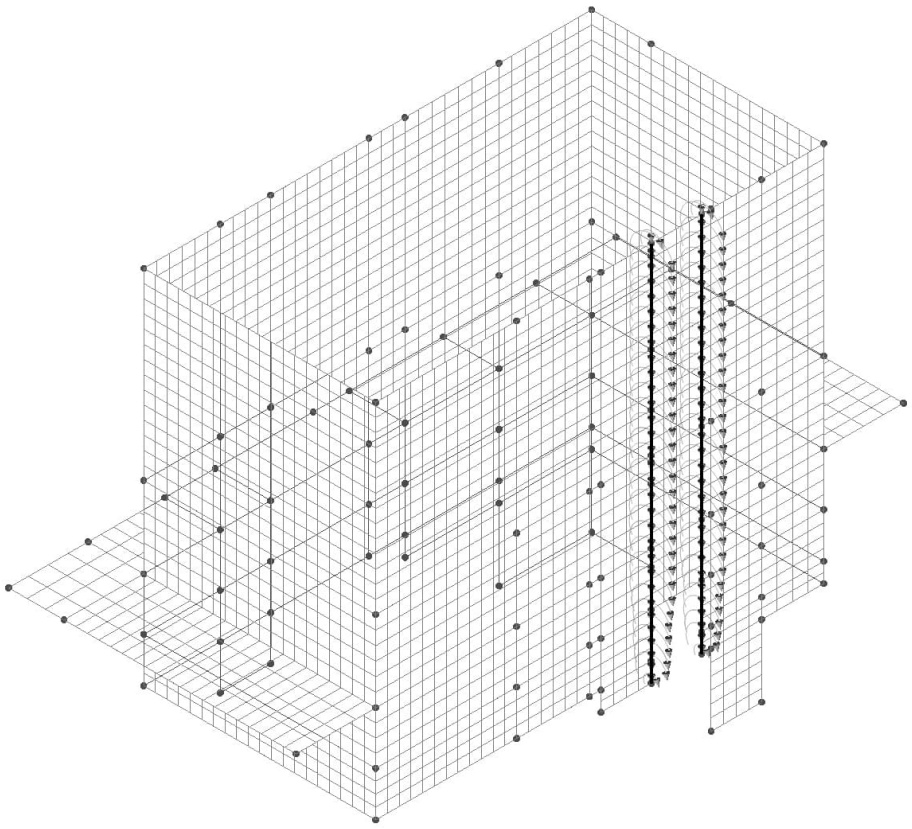
3.1.4.1 Water level H0 (Load case DC_4 – H0)

Water level H0 : WL = +67.0

$$P_c = \gamma_c \cdot V = 24\frac{kN}{m^3} \cdot (19.5m \cdot 4.15m \cdot 0.8m) = 1554kN$$

$$p_z = \frac{P_c}{l} = \frac{1554kN}{18.88m} = 82\frac{kN}{m}$$

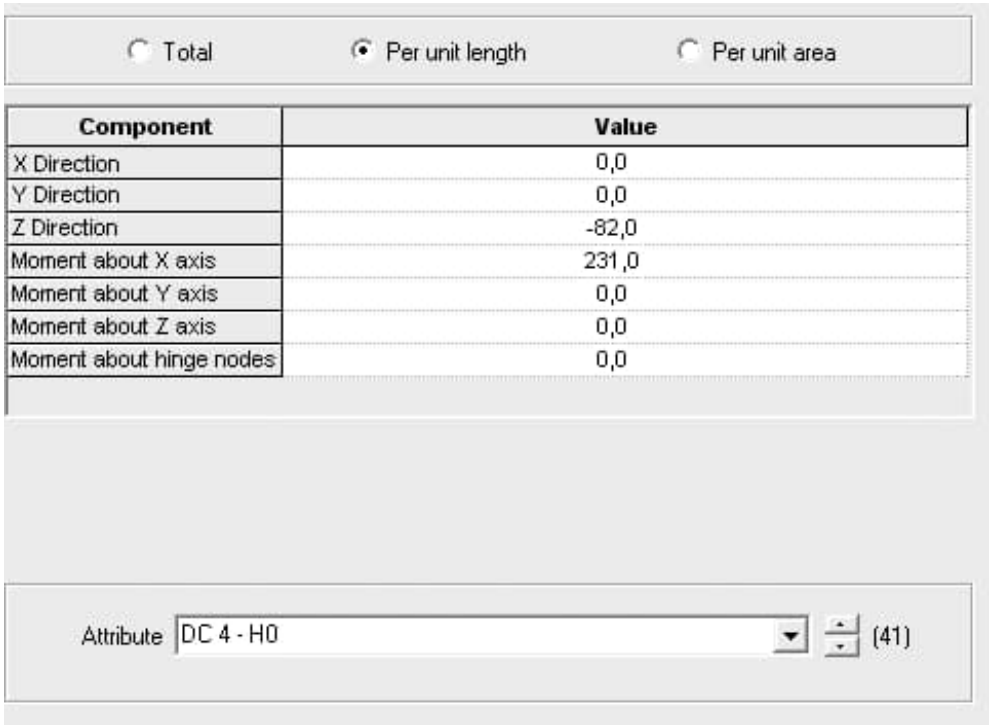
$$m_x = p_z \cdot e = 82\frac{kN}{m} \cdot (0.75m + \frac{4.15m}{2}) = 231\frac{kNm}{m}$$



Loading : DC 4 – H0

Structural loading : Global distributed

Force type : Per unit length



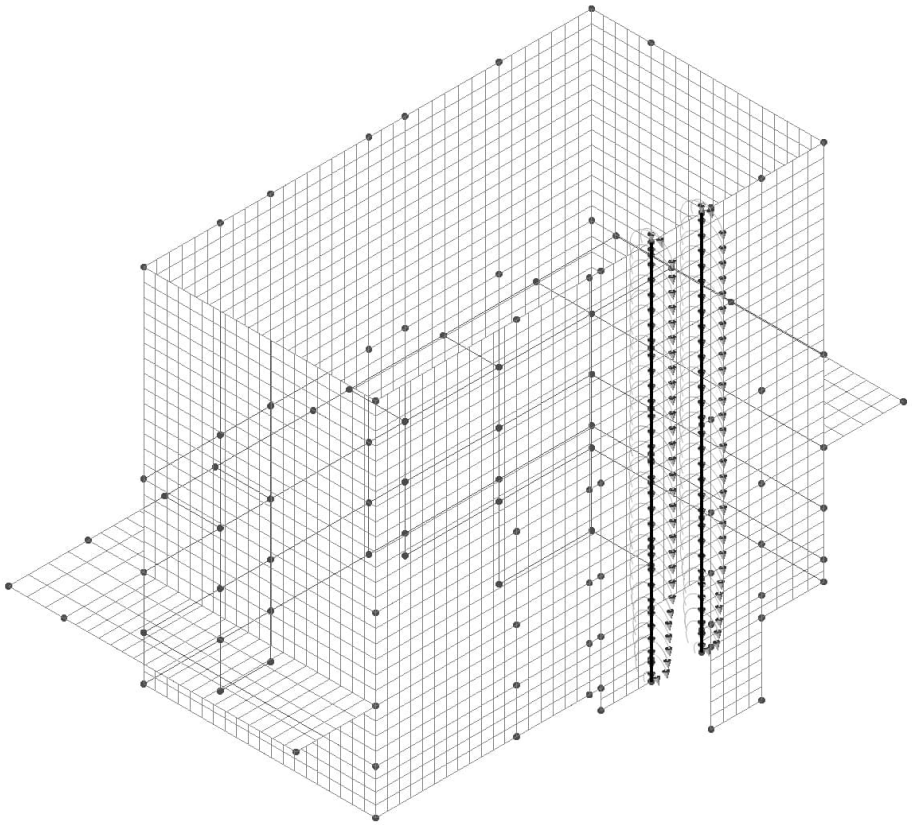
3.1.4.2 Water level H1 (Load case DC_4 – H1)

Water level H1 : WL = +78.65

$$P_c = (24\frac{kN}{m^3} \cdot (90.61m - 78.65m) + (78.65m - 71.11m) \cdot 14\frac{kN}{m^3}) \cdot 4.15m \cdot 0.8m = 1303kN$$

$$p_z = \frac{P_c}{l} = \frac{1303kN}{18.88m} = 69\frac{kN}{m}$$

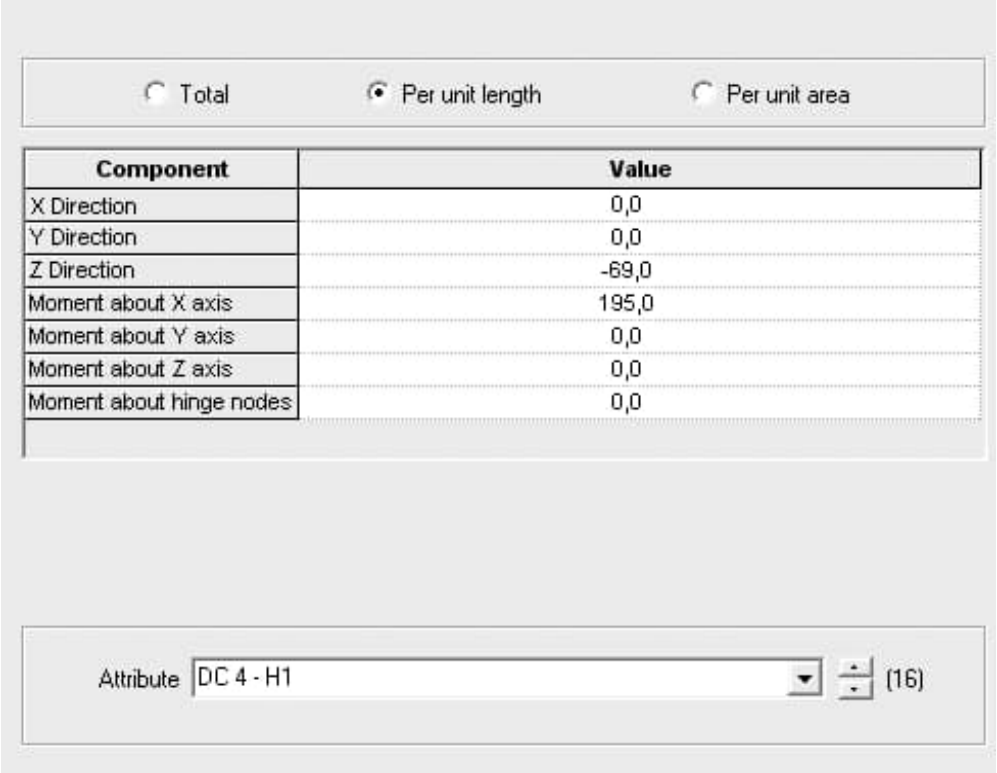
$$m_x = p_z \cdot e = 69\frac{kN}{m} \cdot (0.75m + \frac{4.15m}{2}) = 195\frac{kNm}{m}$$



Loading : DC 4 – H1

Structural loading : Global distributed

Force type : Per unit length



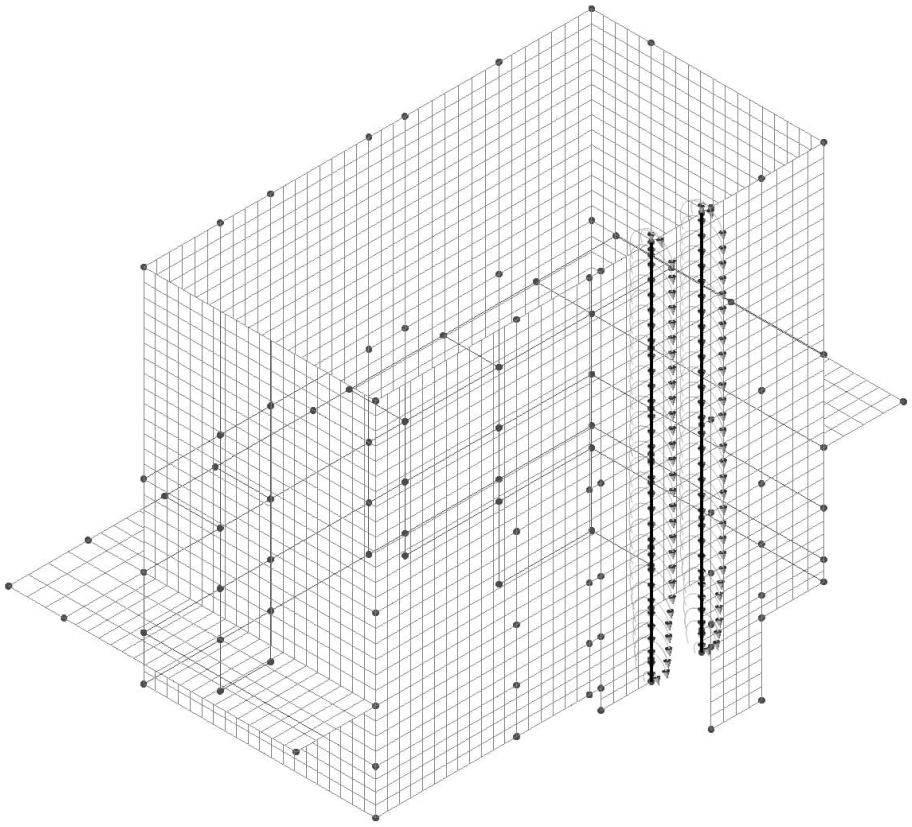
3.1.4.3 Water level H2 (Load case DC_4 – H2)

Water level H2 : WL = +79.65

$$P_c = (24\frac{kN}{m^3} \cdot (90.61m - 79.65m) + (79.65m - 71.11m) \cdot 14\frac{kN}{m^3}) \cdot 4.15m \cdot 0.8m = 1270kN$$

$$p_z = \frac{P_c}{l} = \frac{1270kN}{18.88m} = 67\frac{kN}{m}$$

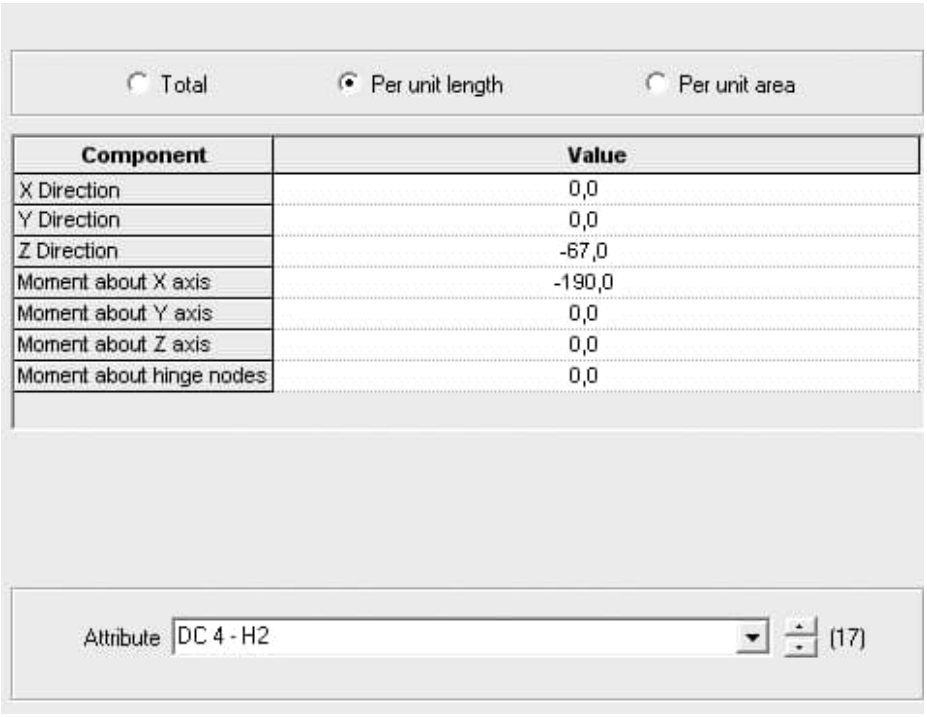
$$m_x = p_z \cdot e = 67\frac{kN}{m} \cdot (0.75m + \frac{4.15m}{2}) = 190\frac{kNm}{m}$$



Loading : DC 4 – H2

Structural loading : Global distributed

Force type : Per unit length



3.1.4.4 Water level H3 (Load case DC_4 – H3)

Water level H3 : WL = +90.60

$$P_c = (24\frac{kN}{m^3} \cdot (90.61m - 90.60m) + (90.60m - 71.11m) \cdot 14\frac{kN}{m^3}) \cdot 4.15m \cdot 0.8m = 907kN$$

$$p_z = \frac{P_c}{l} = \frac{907kN}{18.88m} = 48\frac{kN}{m}$$

$$m_x = p_z \cdot e = 67\frac{kN}{m} \cdot (0.75m + \frac{4.15m}{2}) = 136\frac{kNm}{m}$$

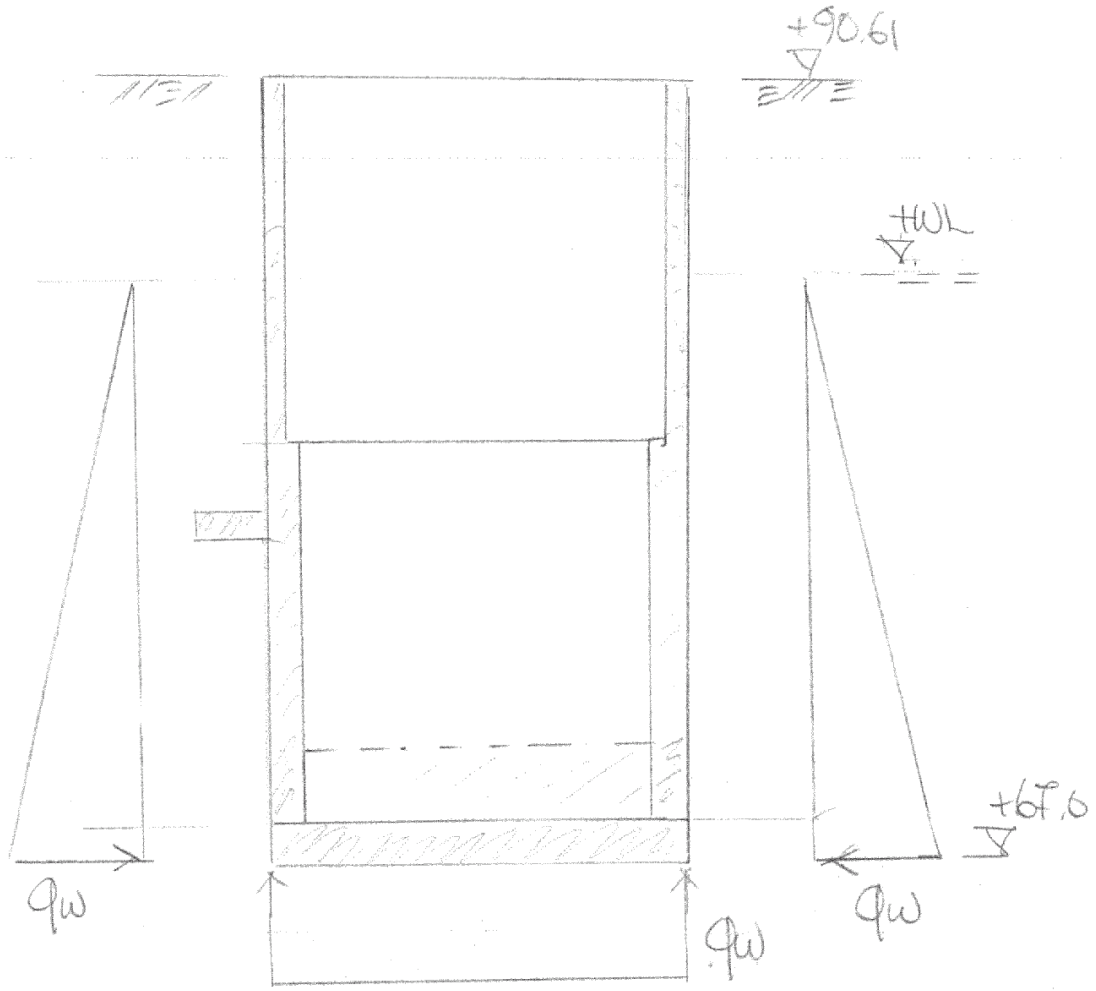
3.2 WATER LOAD (WA)

Due to varying water flow level the following levels are studied levels H0, H1, H2 and H3.



3.2.1 Water level H0

Water level H0 : WL = +67.0

⇒ No water pressure acting !

3.2.2 Water level H1

Water level H1 : WL = +78.65

$$q_w = (78.65m - 67.0m) \cdot 1.0 \cdot 10 \frac{kN}{m^3} = 117kPa$$

3.2.2.1 Load at water level H1 against Wall 1

Loadcase : WA Wall 1 – H1

Structural loading : Discrete patch load

Search area : Wall 1

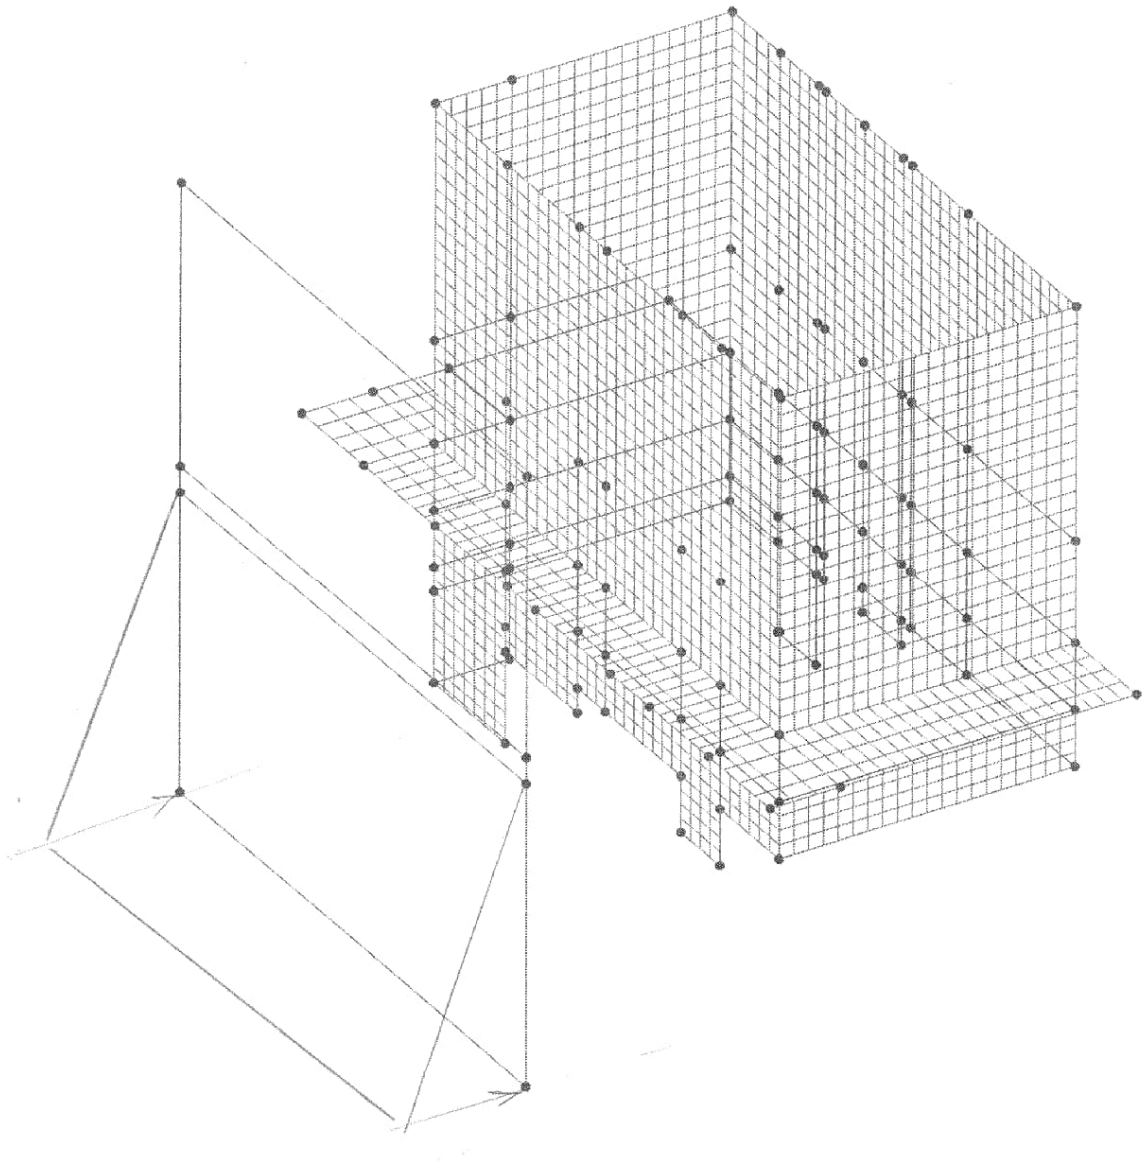
Force type : Per unit area

Component y direction : -117 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in x-direction : 20

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	10,15	15,6	67,0	-117,0
2	-12,05	15,6	67,0	-117,0
3	-12,05	15,6	78,65	0,0
4	10,15	15,6	78,65	0,0



3.2.2.2 Load at water level H1 against Wall 2

Loadcase : WA Wall 2 – H1

Search area : Wall 2

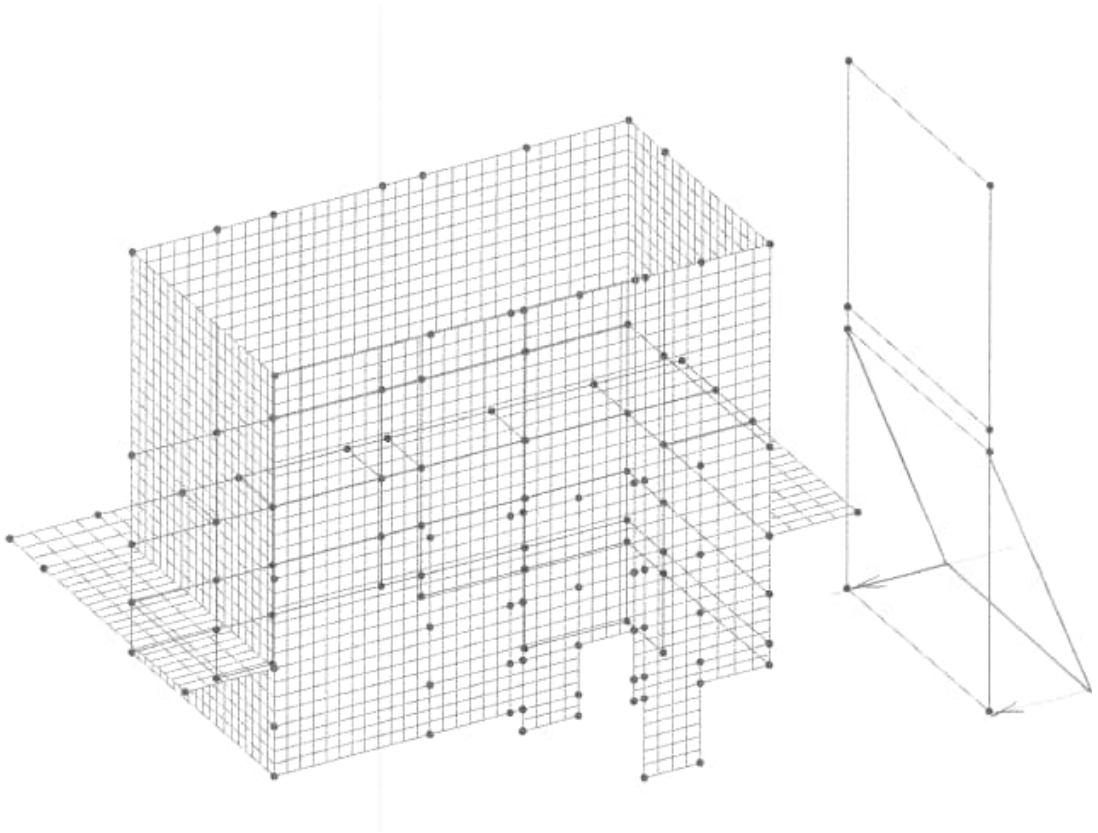
Force type : Per unit area

Component x direction : -117 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in y-direction : 10

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	20,0	-5,75	67,0	-117,0
2	20,0	5,75	67,0	-117,0
3	20,0	5,75	78,65	0,0
4	20,0	-5,75	78,65	0,0



3.2.2.3 Load at water level H1 against Wall 3

Loadcase : WA Wall 3 – H1

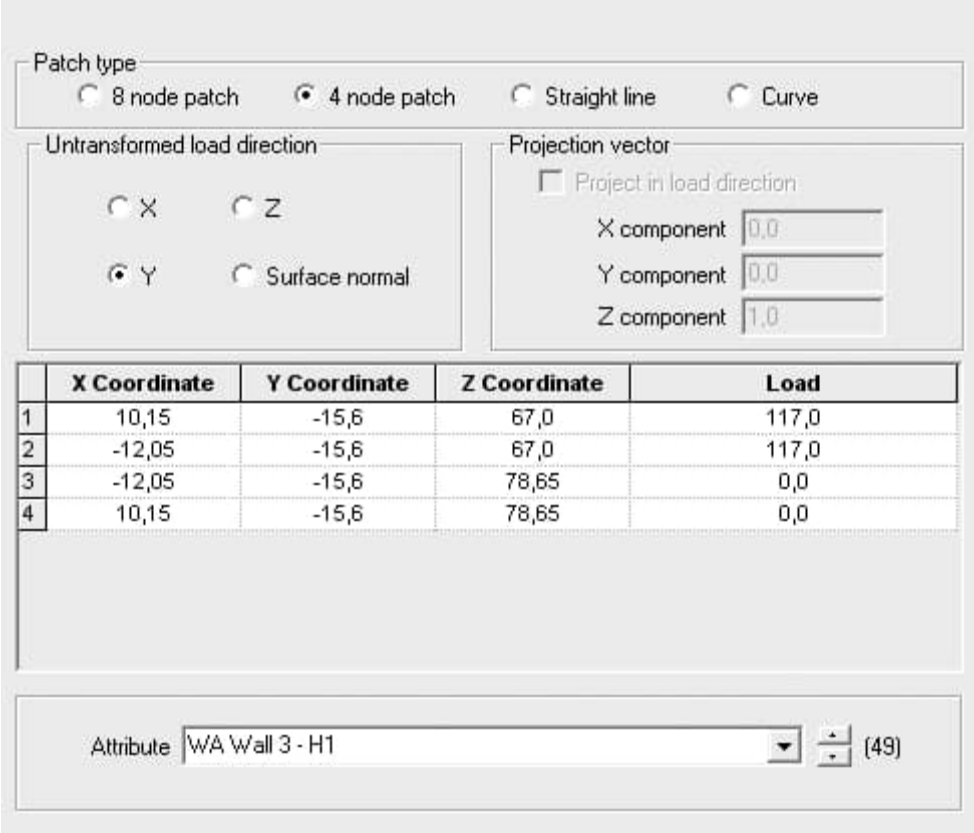
Search area : Wall 3

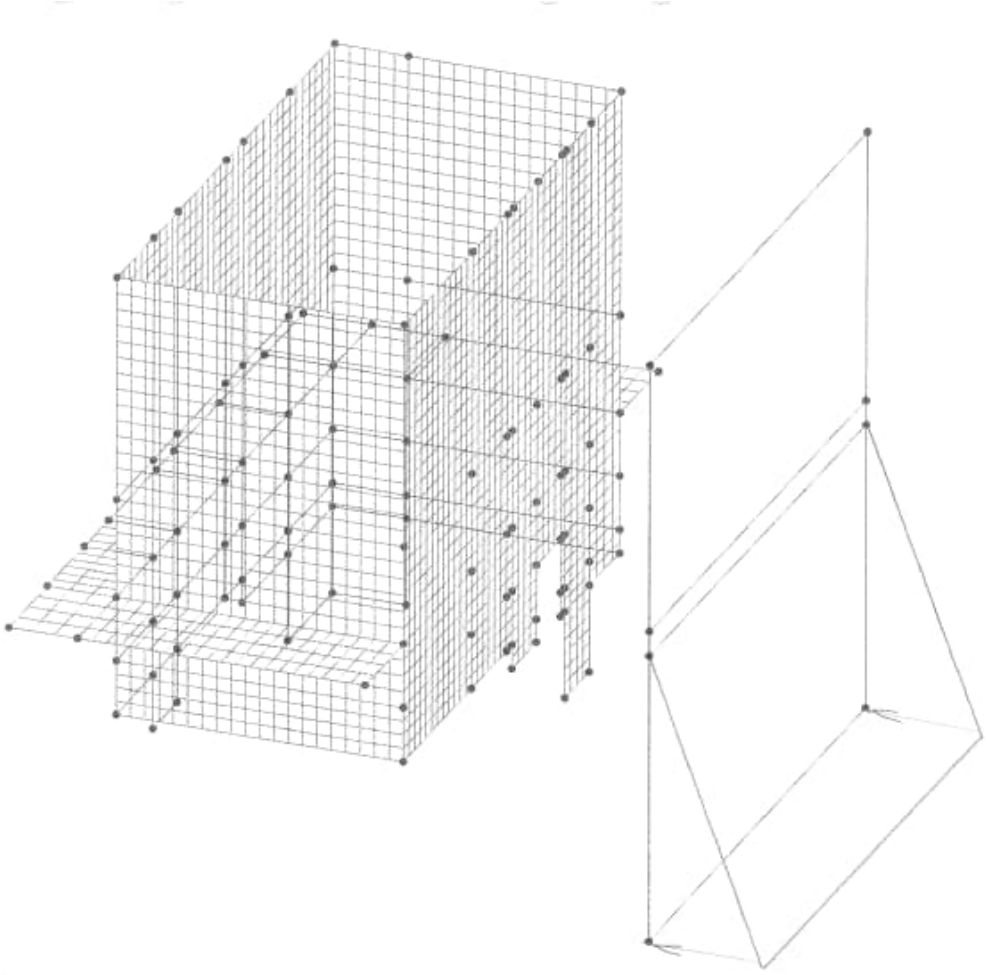
Force type : Per unit area

Component y direction : 117 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in x-direction : 20





3.2.2.4 Load at water level H1 against Wall 4

Loadcase : WA Wall 4 – H1

Search area : Wall 4

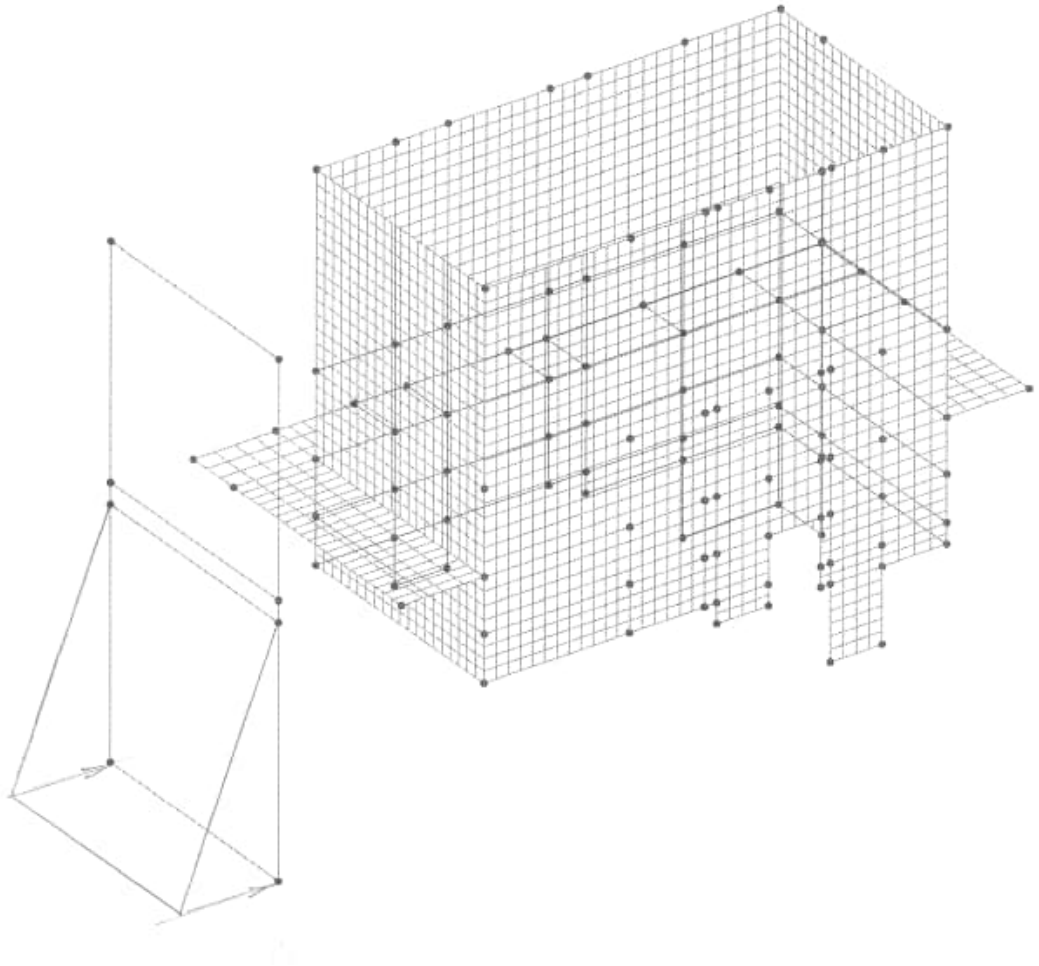
Force type : Per unit area

Component x direction : 117 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in y-direction : 10

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	-21,9	5,75	67,0	117,0
2	-21,9	-5,75	67,0	117,0
3	-21,9	-5,75	78,65	0,0
4	-21,9	5,75	78,65	0,0



3.2.3 Water level H2

Water level H2 : WL = +79.65

$$q_w = (79.65m - 67.0m) \cdot 1.0 \cdot 10 \frac{kN}{m^3} = 127kPa$$

3.2.3.1 Load at water level H2 against Wall 1

Loadcase : WA Wall 1 – H2

Structural loading : Discrete patch load

Search area : Wall 1

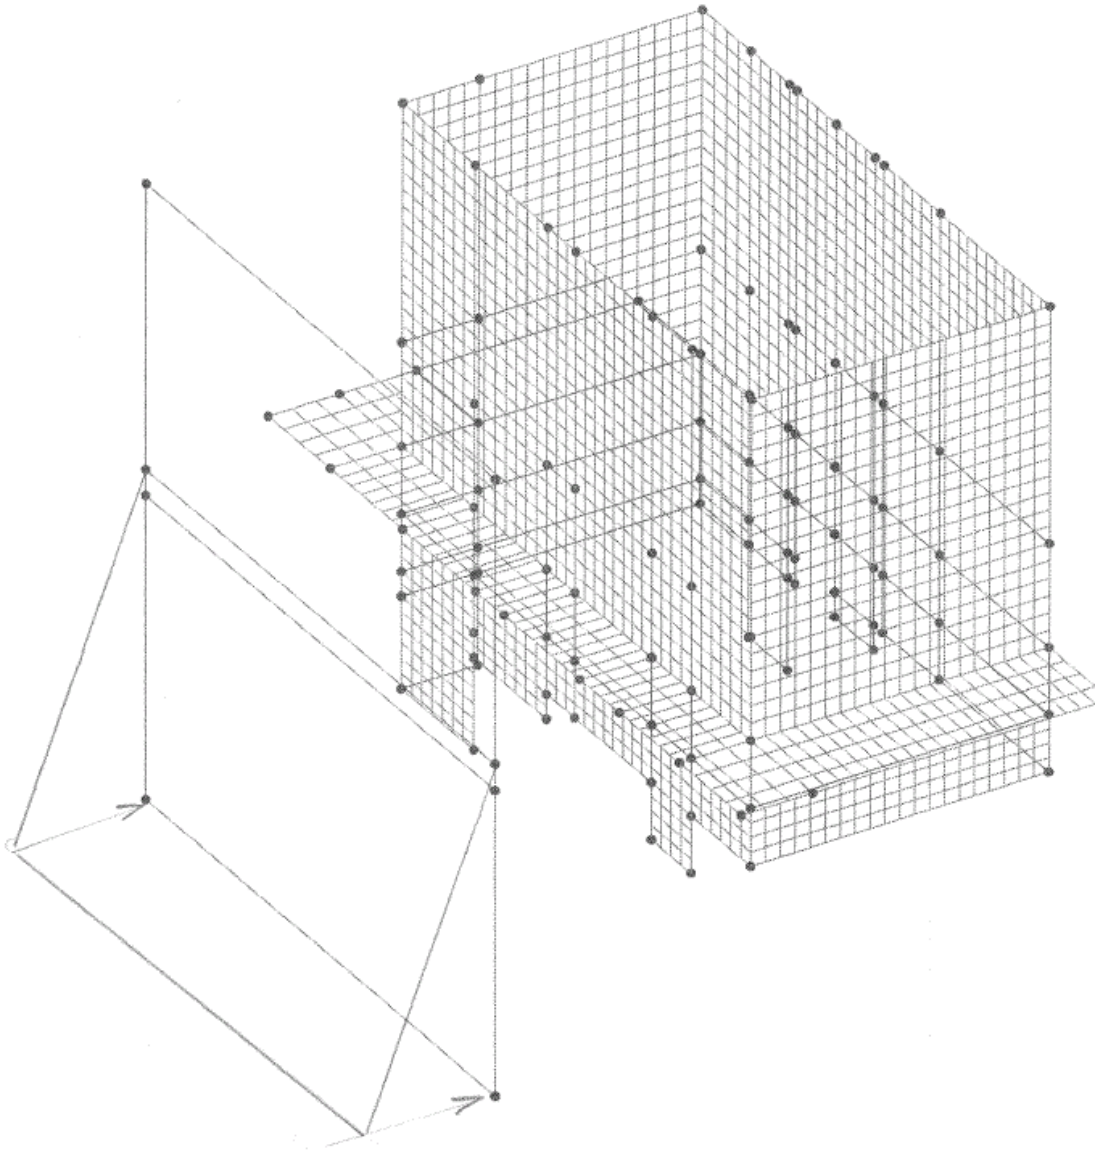
Force type : Per unit area

Component y direction : -127 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in x-direction : 20

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	10,15	15,6	67,0	-127,0
2	-12,05	15,6	67,0	-127,0
3	-12,05	15,6	79,65	0,0
4	10,15	15,6	79,65	0,0



3.2.3.2 Load at water level H2 against Wall 2

Loadcase : WA Wall 2 – H2

Search area : Wall 2

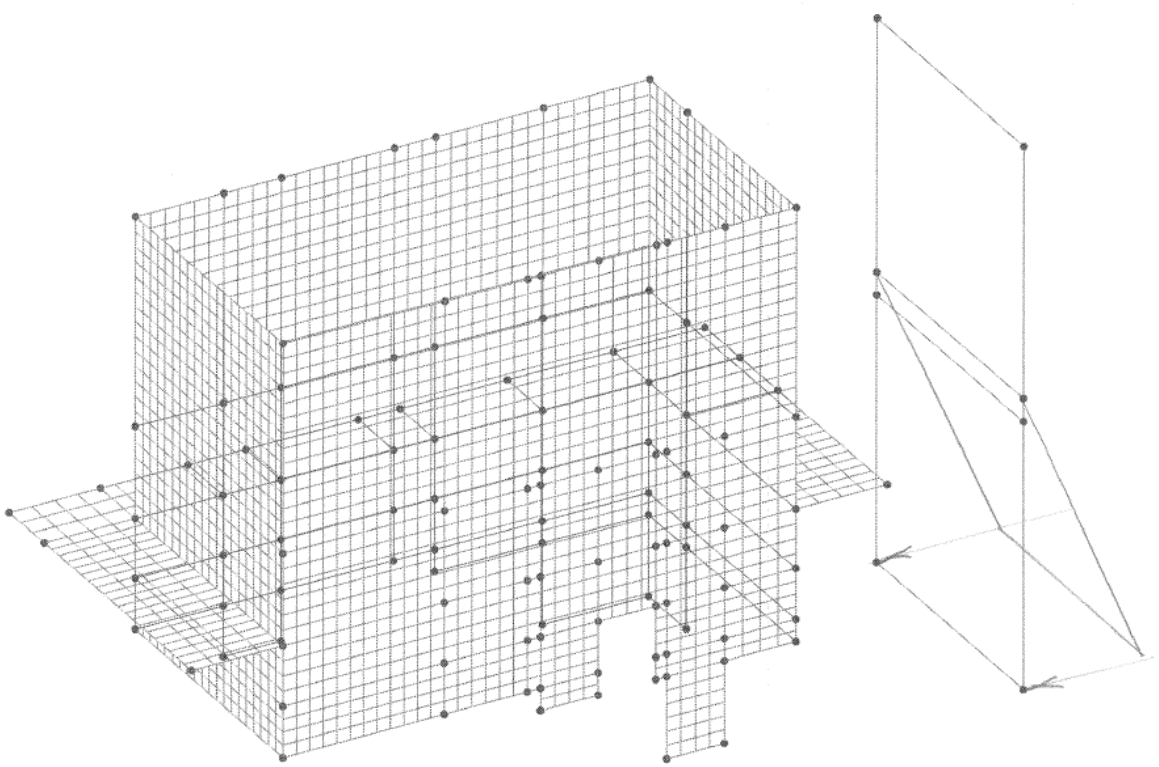
Force type : Per unit area

Component x direction : -127 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in y-direction : 10

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	20,0	-5,75	67,0	-127,0
2	20,0	5,75	67,0	-127,0
3	20,0	5,75	79,65	0,0
4	20,0	-5,75	79,65	0,0



3.2.3.3 Load at water level H2 against Wall 3

Loadcase : WA Wall 3 – H2

Search area : Wall 3

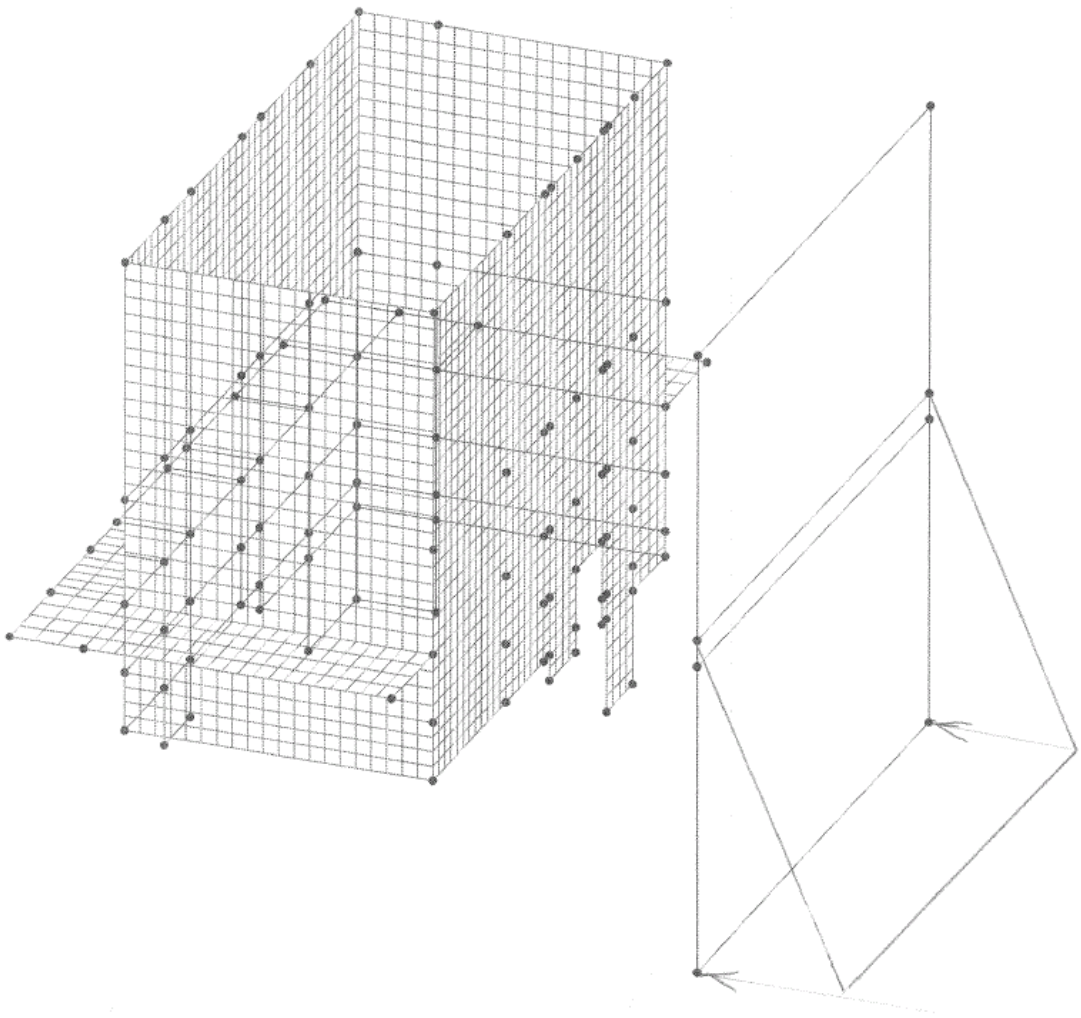
Force type : Per unit area

Component y direction : 127 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in x-direction : 20

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	10,15	-15,6	67,0	127,0
2	-12,05	-15,6	67,0	127,0
3	-12,05	-15,6	79,65	0,0
4	10,15	-15,6	79,65	0,0



3.2.3.4 Load at water level H2 against Wall 4

Loadcase : WA Wall 4 – H2

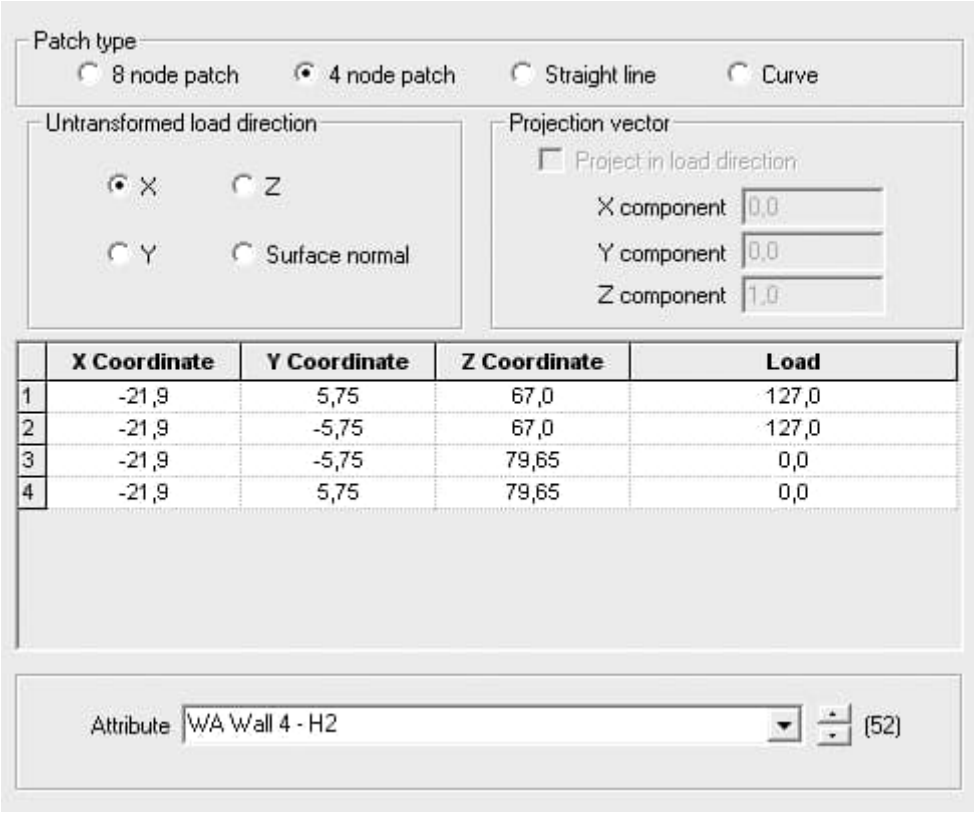
Search area : Wall 4

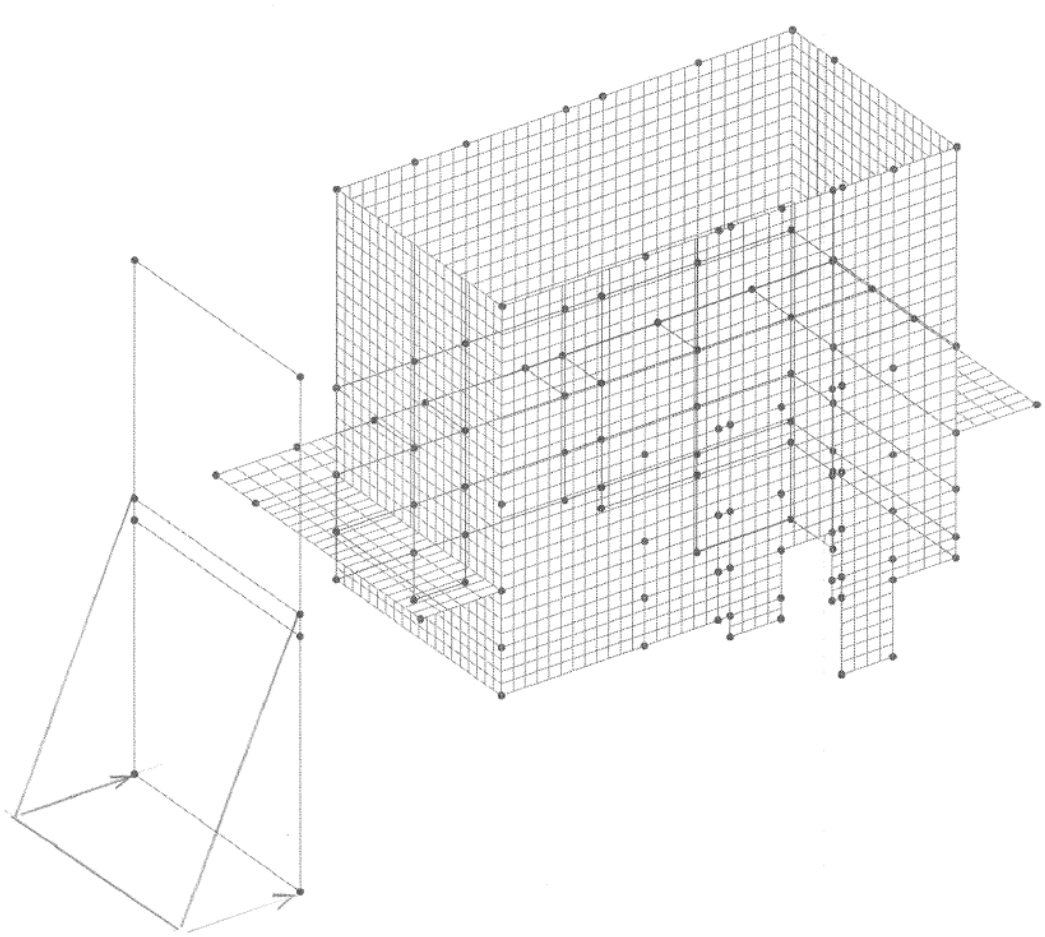
Force type : Per unit area

Component x direction : 127 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in y-direction : 10





3.2.4 Water level H3

Water level H3 : WL = +90.60

$$q_w = (90.6m - 67.0m) \cdot 1.0 \cdot 10 \frac{kN}{m^3} = 236kPa$$

3.2.4.1 Load at water level H3 against Wall 1

Loadcase : WA Wall 1 – H3

Structural loading : Discrete patch load

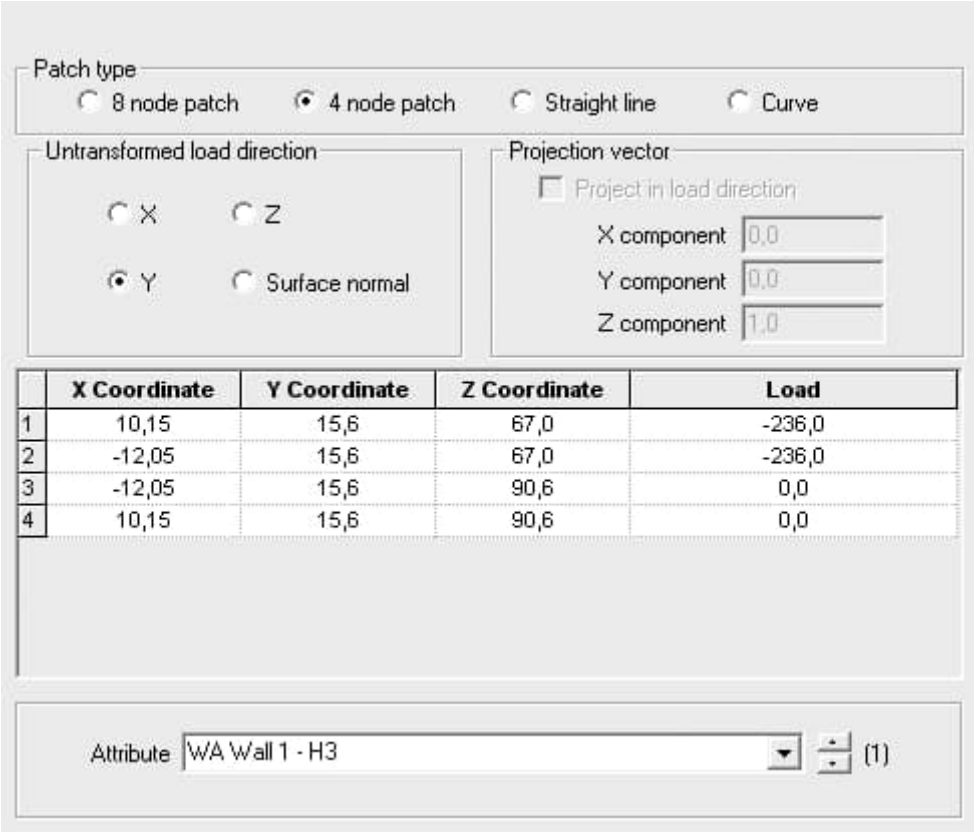
Search area : Wall 1

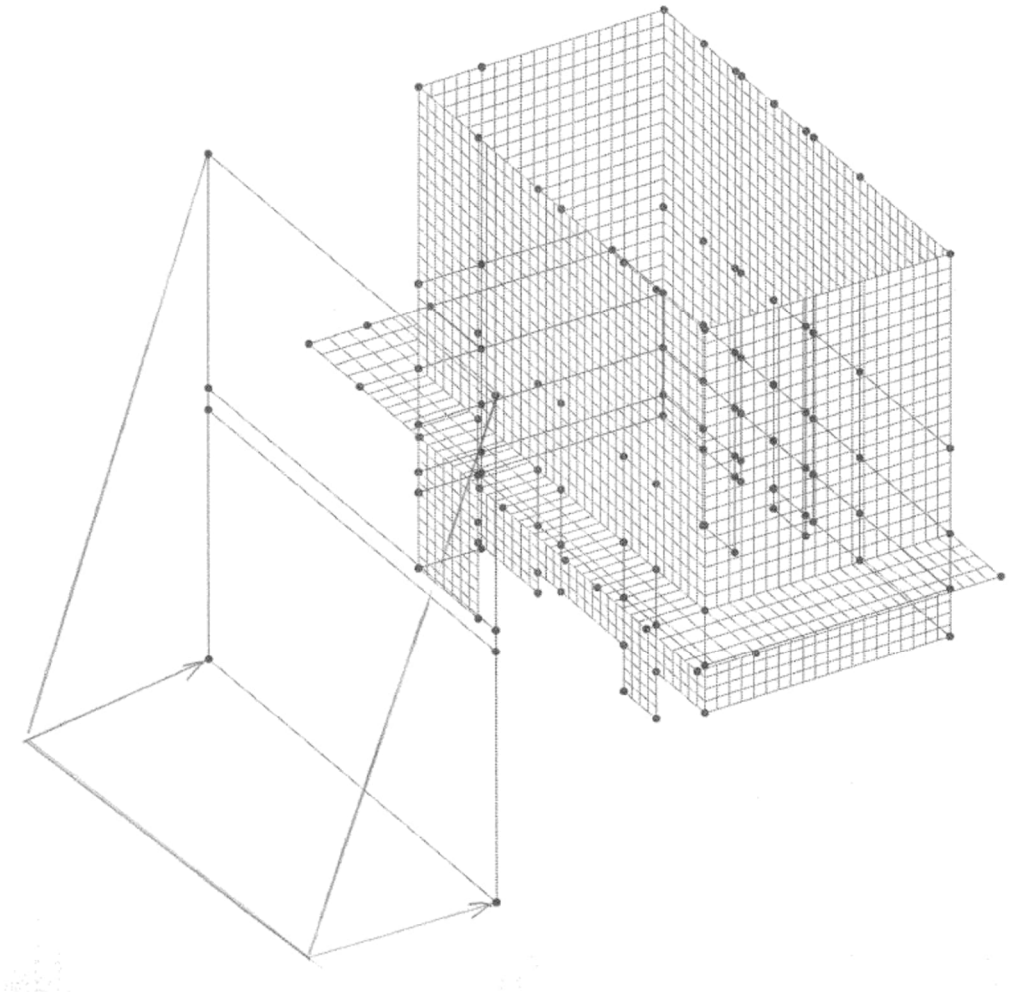
Force type : Per unit area

Component y direction : -236 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in x-direction : 20





3.2.4.2 Load at water level H3 against Wall 2

Loadcase : WA Wall 2 – H3

Search area : Wall 2

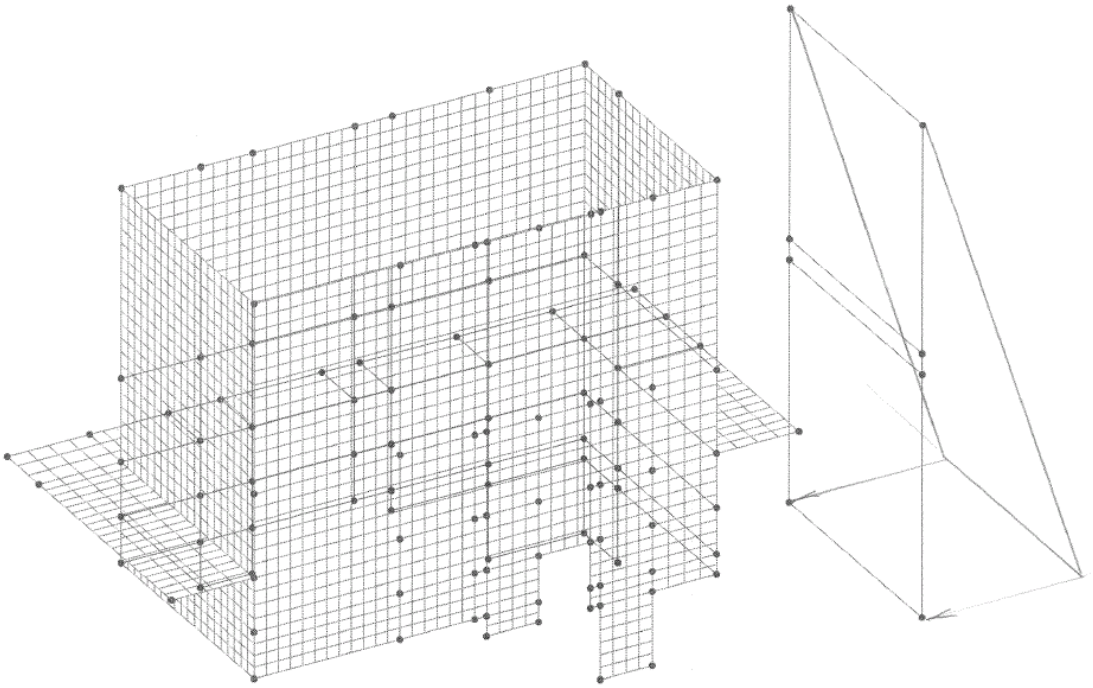
Force type : Per unit area

Component x direction : -236 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in y-direction : 10

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	20,0	-5,75	67,0	-236,0
2	20,0	5,75	67,0	-236,0
3	20,0	5,75	90,6	0,0
4	20,0	-5,75	90,6	0,0



3.2.4.3 Load at water level H3 against Wall 3

Loadcase : WA Wall 3 – H3

Search area : Wall 3

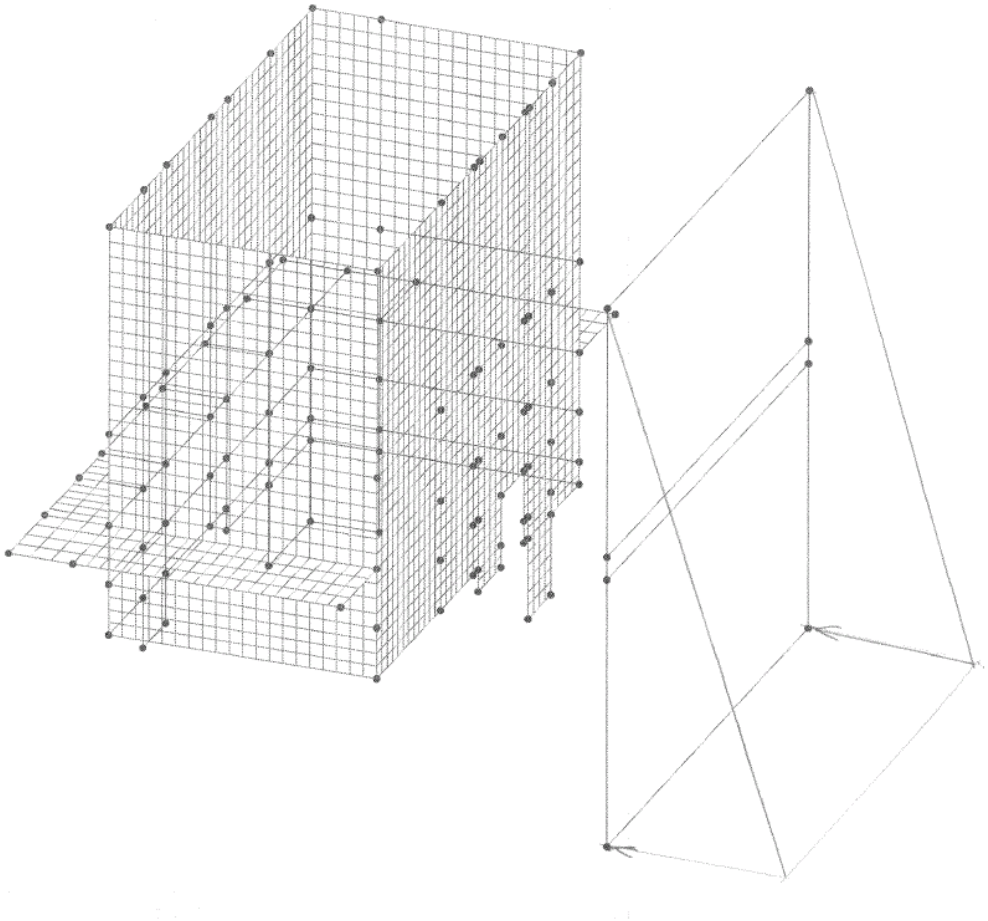
Force type : Per unit area

Component y direction : 236 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in x-direction : 20

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	10,15	-15,6	67,0	236,0
2	-12,05	-15,6	67,0	236,0
3	-12,05	-15,6	90,6	0,0
4	10,15	-15,6	90,6	0,0



3.2.4.4 Load at water level H3 against Wall 4

Loadcase : WA Wall 4 – H3

Search area : Wall 4

Force type : Per unit area

Component x direction : 236 kPa

Options for load outside search area : Exclude All Load

Divisions of patch load in y-direction : 10

	X Coordinate	Y Coordinate	Z Coordinate	Load

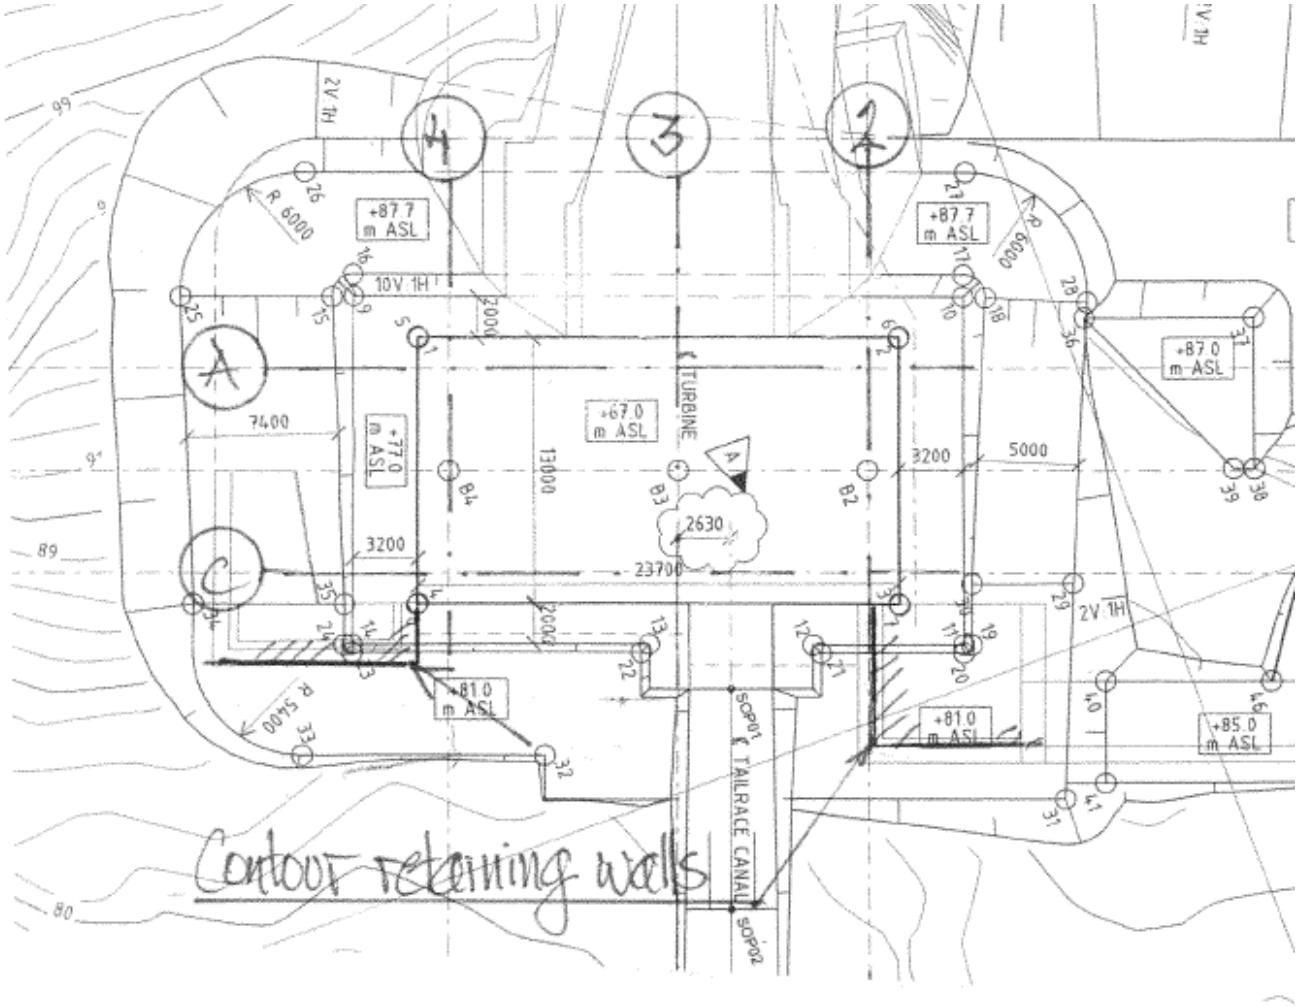
2	WA Wall 2 - H3	118	1	-1	1
3	WA Wall 3 - H3	153	1	-1	1
4	WA Wall 4 - H3	120	1	-1	1

3.3 EARTH PRESSURE

Due to varying water flow level the following levels are studied levels H0, H1, H2 and H3.

Earth pressure is applied to structure between level +77.0 and +90.61 against wall 1.
Against wall 2 and 4 earth pressure is applied to structure between level +78.0 and +90.61.
Against 3 no earth pressure is applied due to connecting retaining walls, see sketch below.



Earth properties :

$K_0 = 1 - \sin 38^o = 0.38$

$\gamma_e = 18 \frac{kN}{m^3}$

$\gamma_e' = 11 \frac{kN}{m^3}$

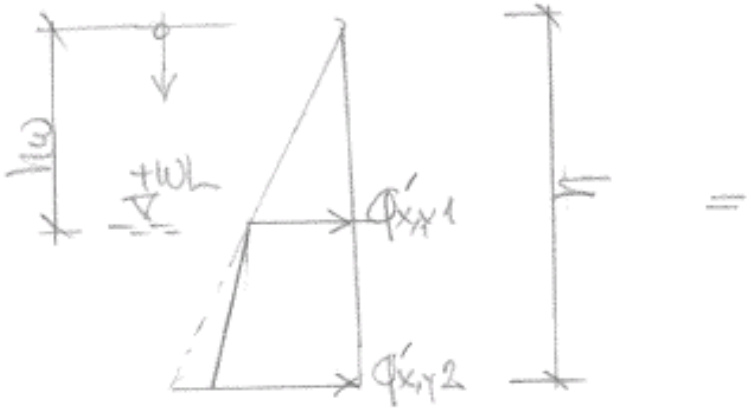
Earth pessure :

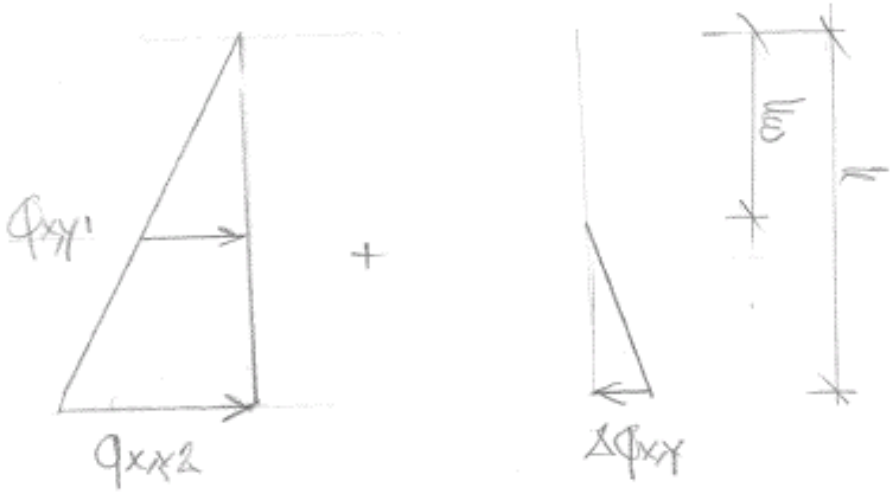
$q'_{x,y}(s) = K_0 \cdot s \cdot \gamma$: s ≤ hw

$q'_{x,y}(s) = K_0 \cdot (h_w \cdot \gamma + (s - h_w) \cdot \gamma')$: s > hw

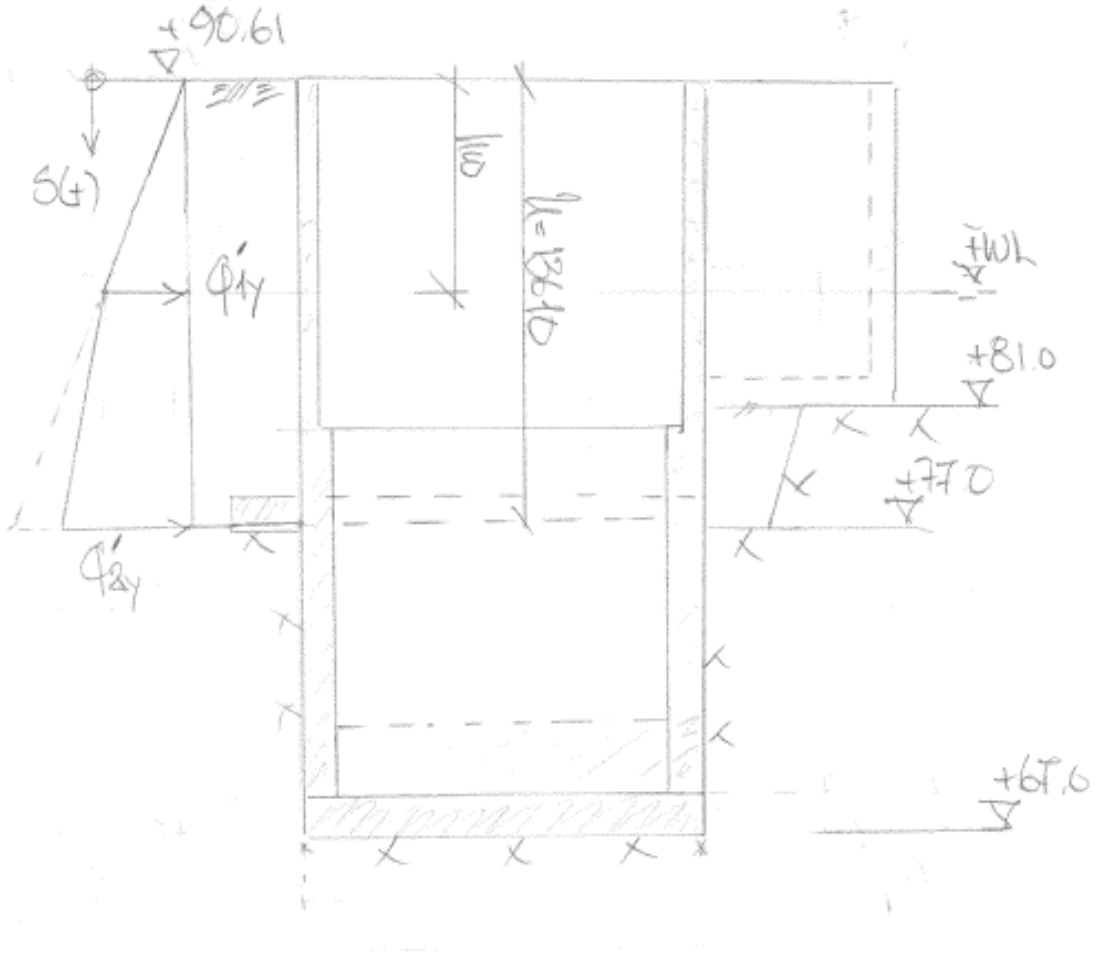
When studying the effect of varying water levels load is devided into two parts as seen below.

$q'_{x,y}(s) = q_{x,y}(s) - \Delta q_{x,y}(s)$

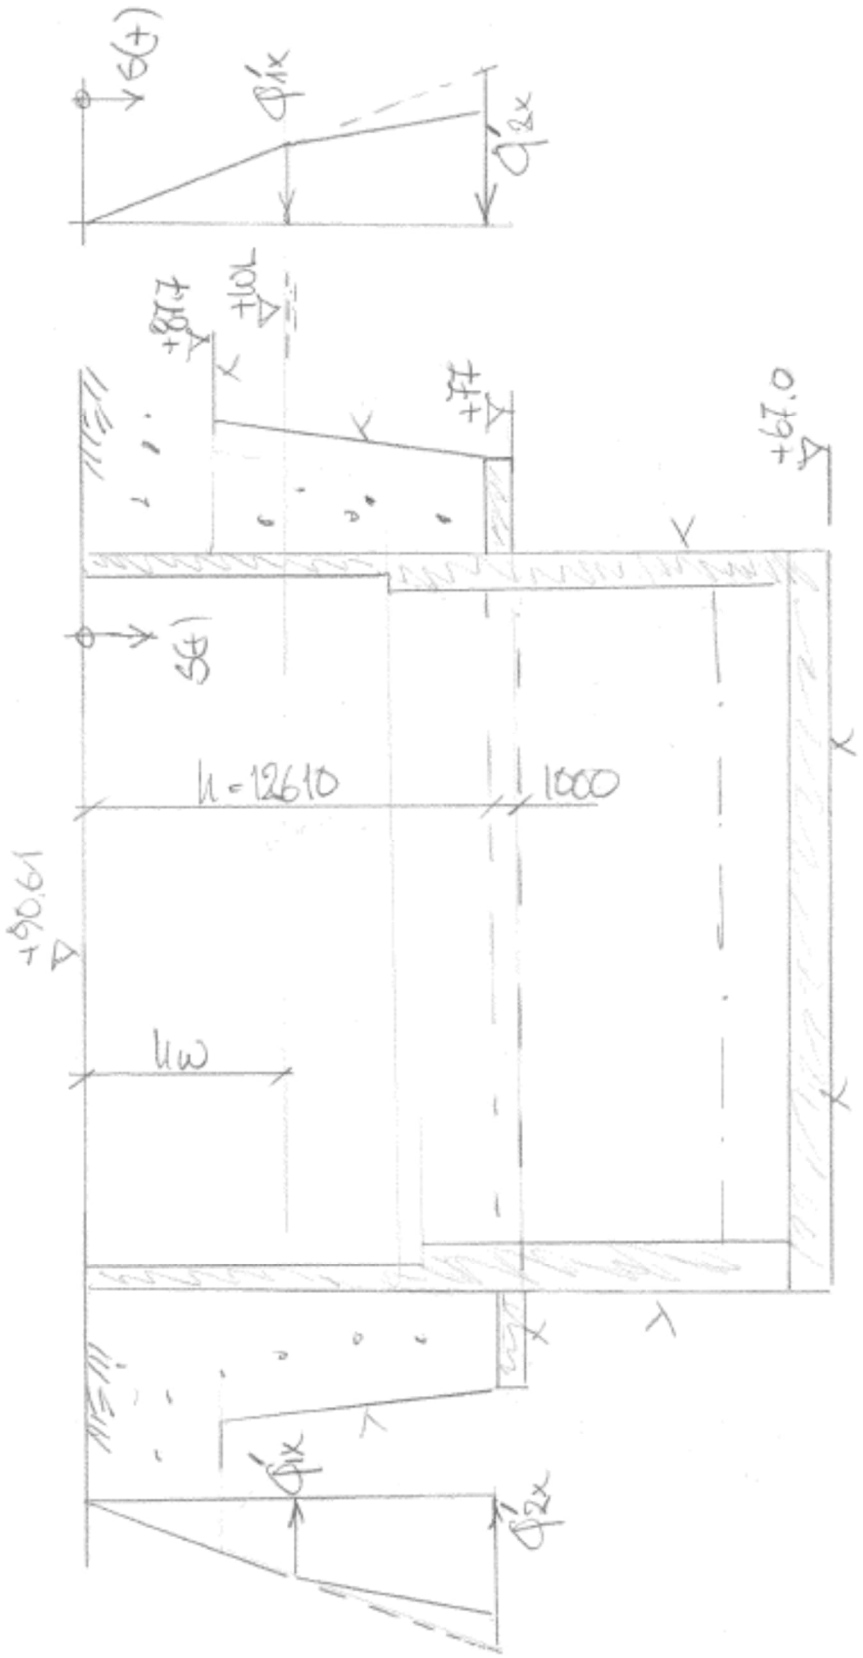




Sketch of earth pressure against Wall 1 :



Sketch of earth pressure against Wall 2 and 4 :



3.3.1 Water level H0

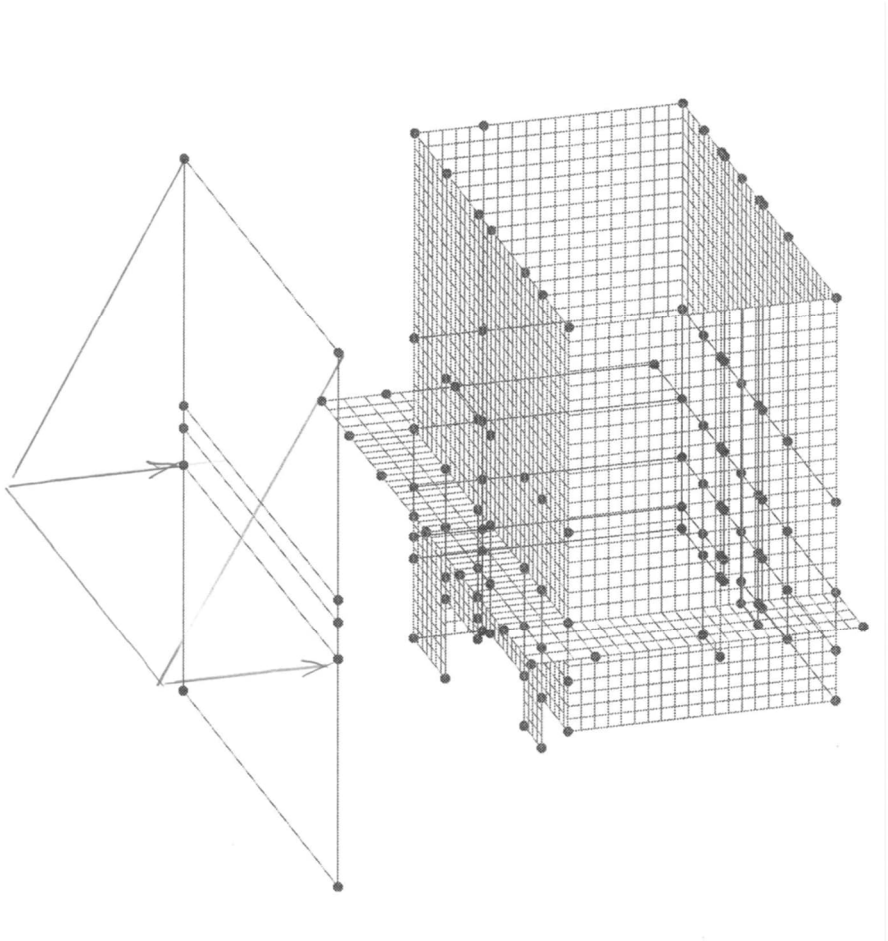
Water level H0 : +67.0

3.3.1.1 Load against wall 1

$$q_y(s = 0m) = 0kPa$$

$$q_{y1} = q_y(s = 13.61m) = (90.61m - 77.0m) \cdot 0.38 \cdot 18\frac{kN}{m^3} = 93kPa$$

$$q_{y2} = q_y(s = 13.61m) = (90.61m - 77.0m) \cdot 0.38 \cdot 18\frac{kN}{m^3} = 93kPa$$



.....

3.4 SURCHARGE

Surcharge is applied to structure between level +77.00 and +90.61 against wall 1.
Against wall 2 and 4 surcharge is applied to structure between level +78.00 and +90.61.
Against wall 3 no surcharge is applied due to connecting retaining walls (compare with load earth pressure).

Surcharges is applied continuously along all sides but independently. The assumption is as considered as on the safe side with regard to stressed in wall structure.

Load properties :

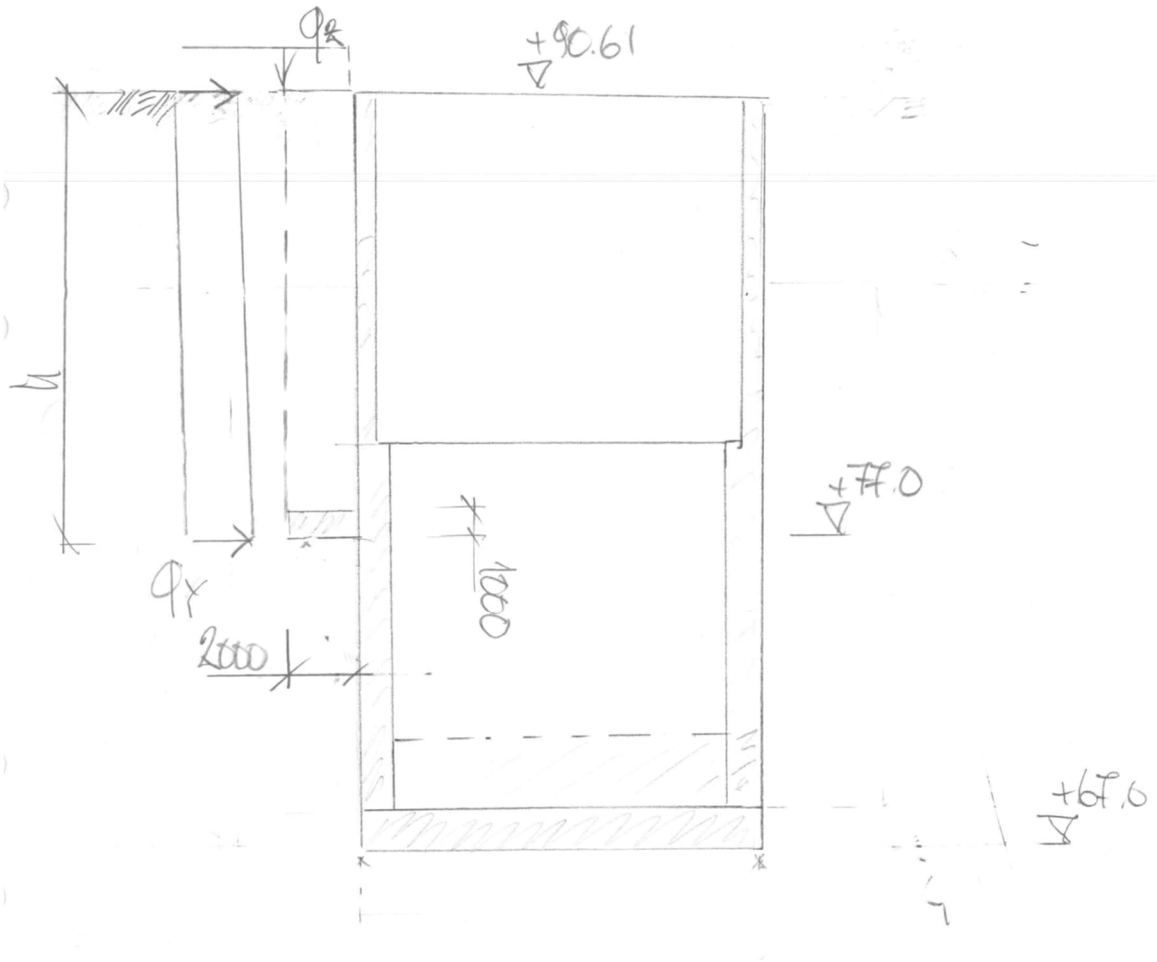
$K_0 = 0.38$

$q_{surcharge} = 10kPa$

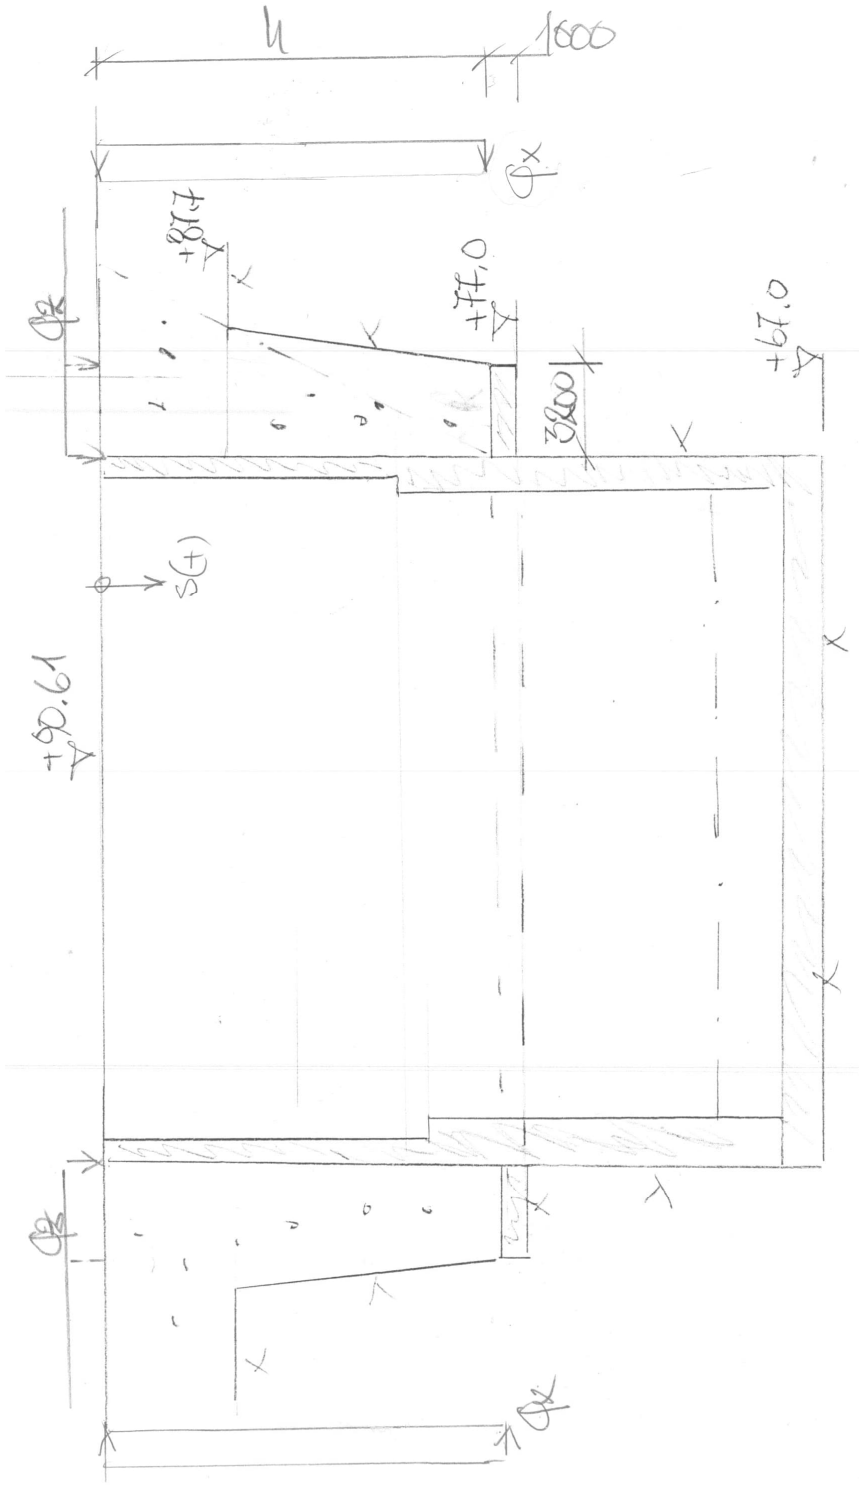
$q_{x,y} = K_0 \cdot q_{surcharge} = 3.8kPa$

$q_z = 10kPa$

Sketch of earth pressure against Wall 1 :



Sketch of earth pressure against Wall 2 and 4 :



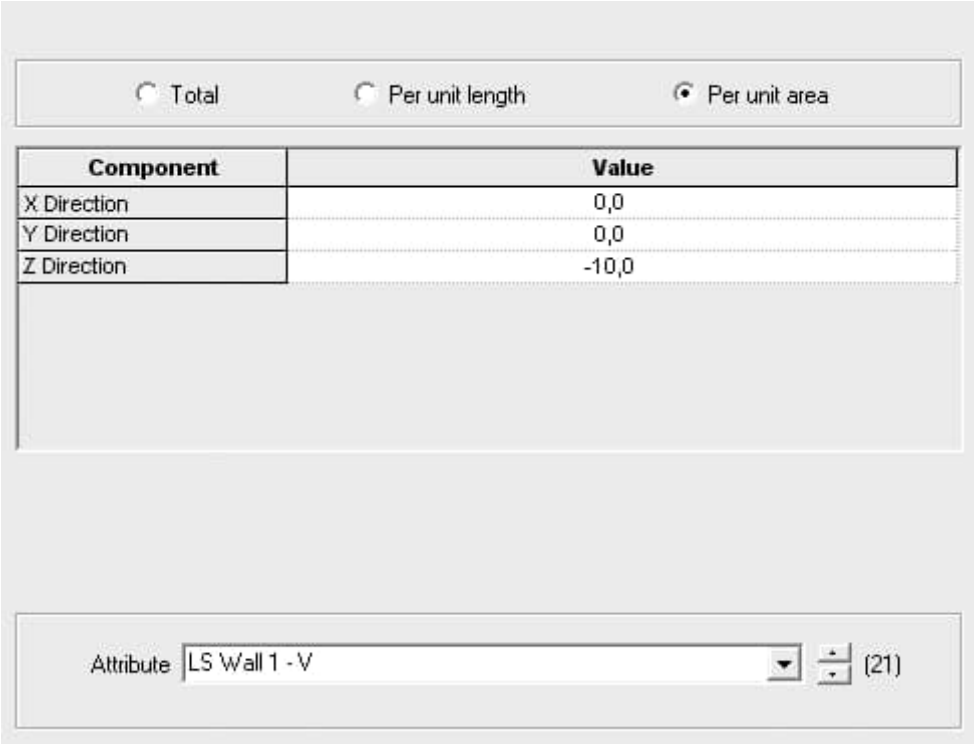
3.4.1 Vertical contribution

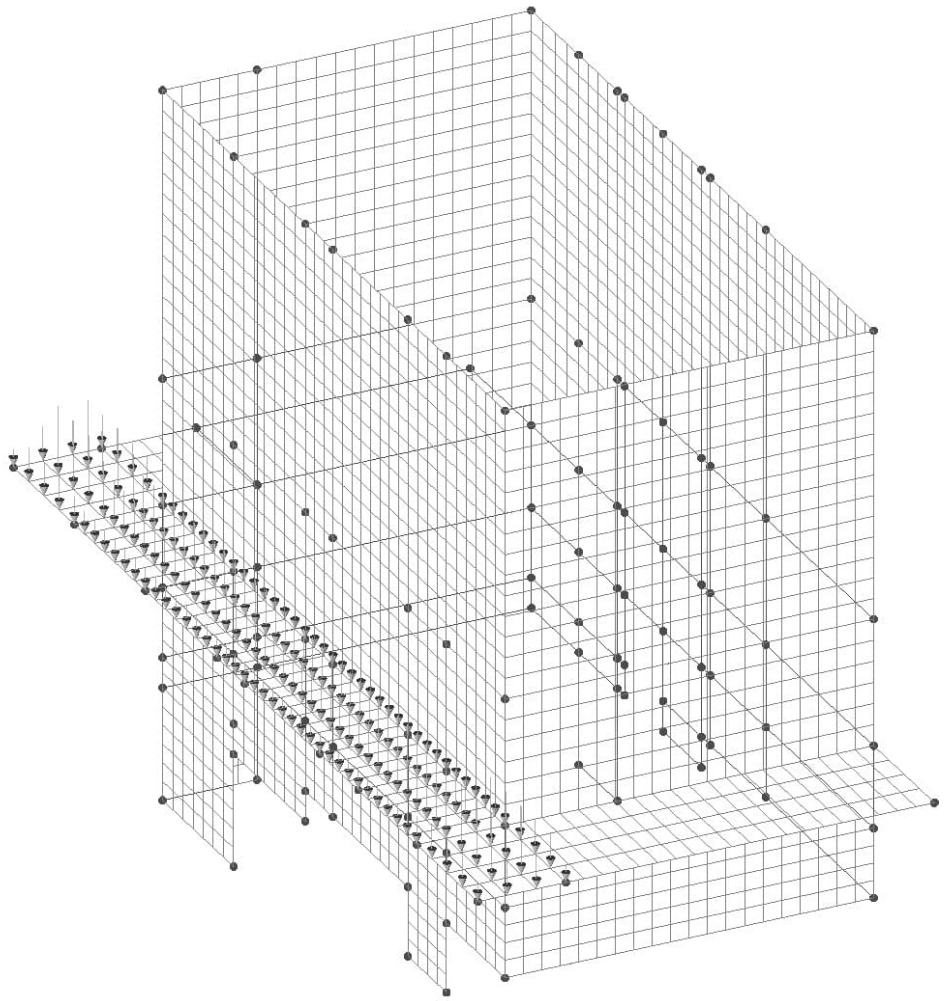
3.4.1.1 Load against wall 1 (Load case LS Wall 1 – V)

Structural loading : Global distributed

Force type : Per unit area

Component z direction : -10 $\frac{kN}{m^2}$



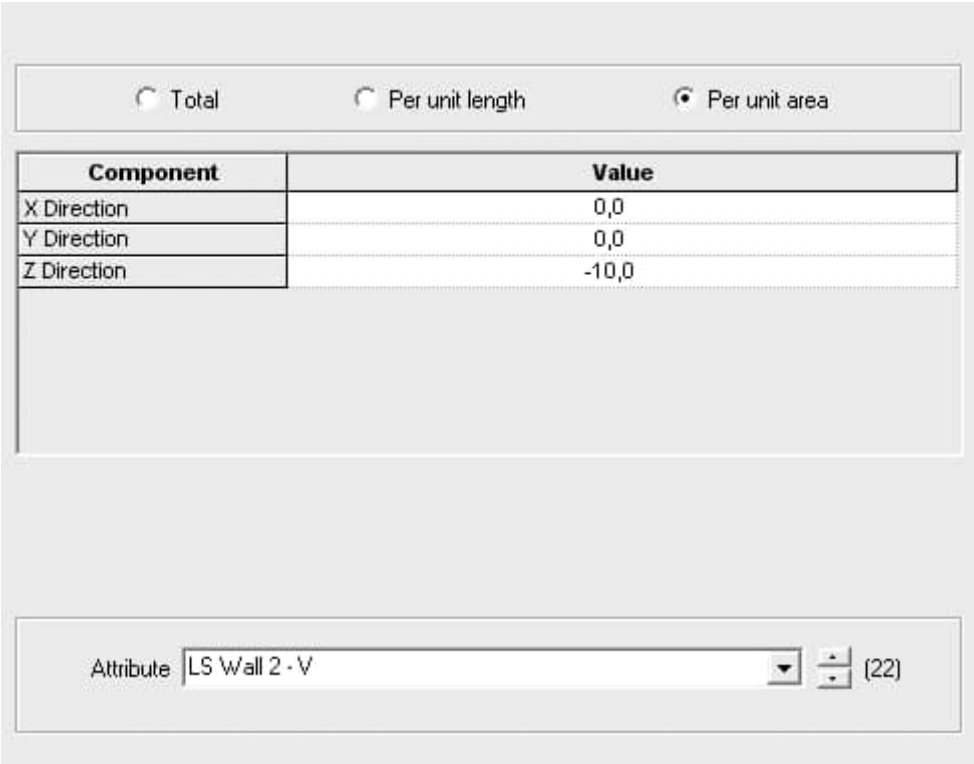


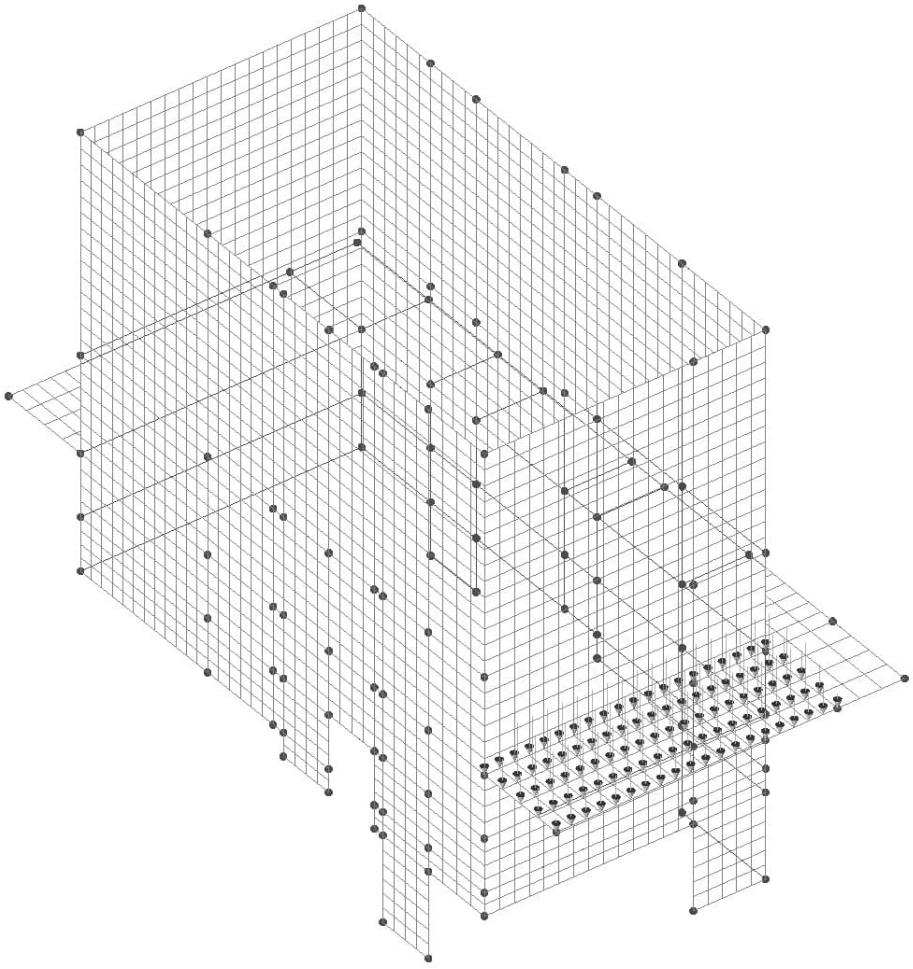
3.4.1.2 Load against wall 2 (Load case LS Wall 2 – V)

Structural loading : Global distributed

Force type : Per unit area

Component z direction : -10 $\frac{kN}{m^2}$



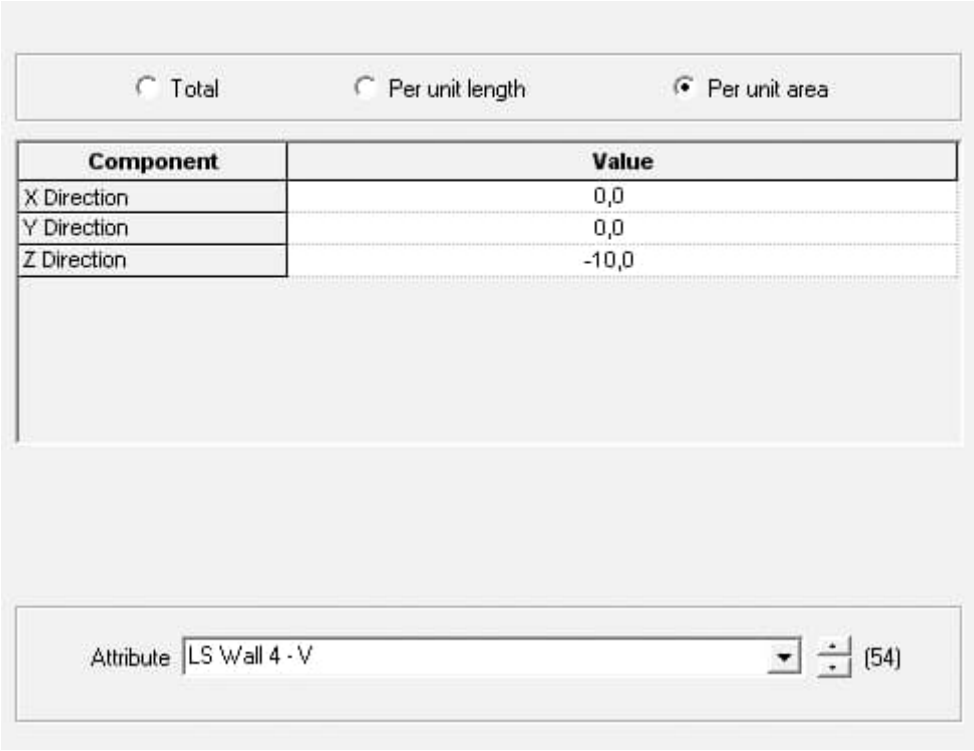


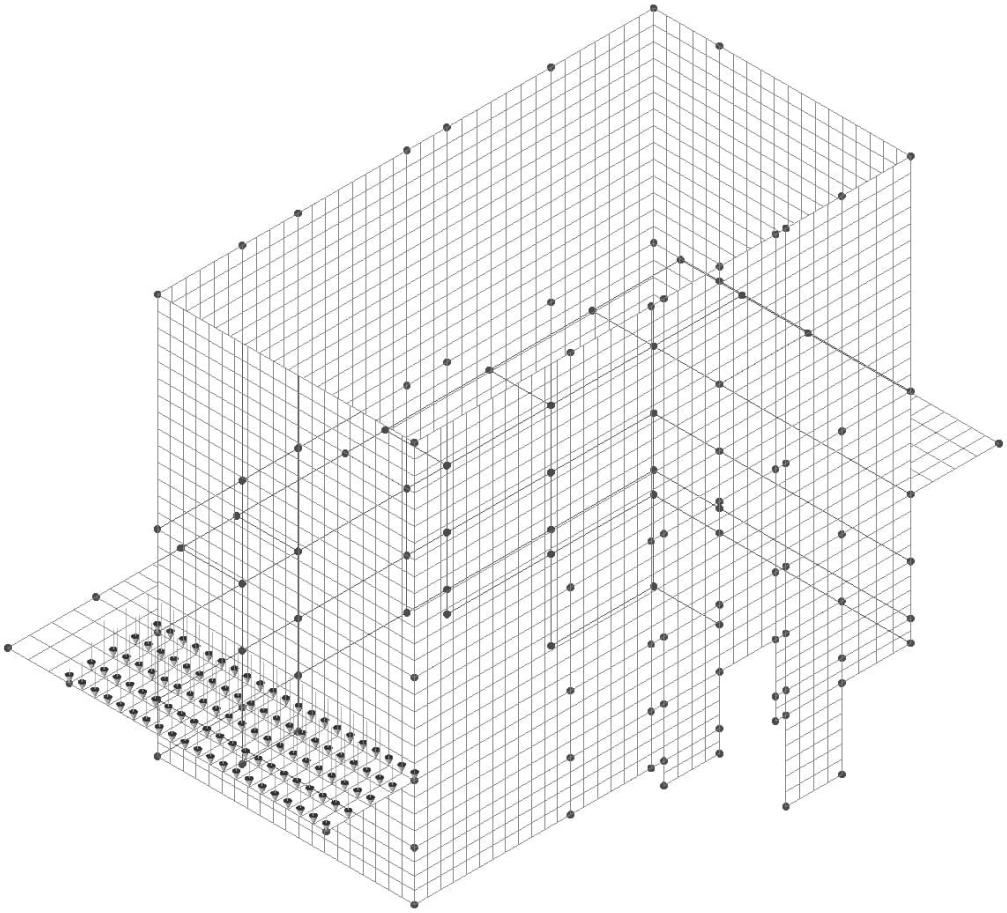
3.4.1.3 Load against wall 4 (Load case LS Wall 4 – V)

Structural loading : Global distributed

Force type : Per unit area

Component z direction : -10 $\frac{kN}{m^2}$





3.4.2 Horizontal contribution

3.4.2.1 Load against wall 1 (Load case LS Wall 1 – H)

Structural loading : Discrete patch load

Search area : Exterior wall 1

Force type : Per unit area

Component y direction : -3.8 kPa

Options for load outside search area : Exclude All Load

	X Coordinate	Y Coordinate	Z Coordinate	Load
1	-12,05	15,6	90,61	-3,8

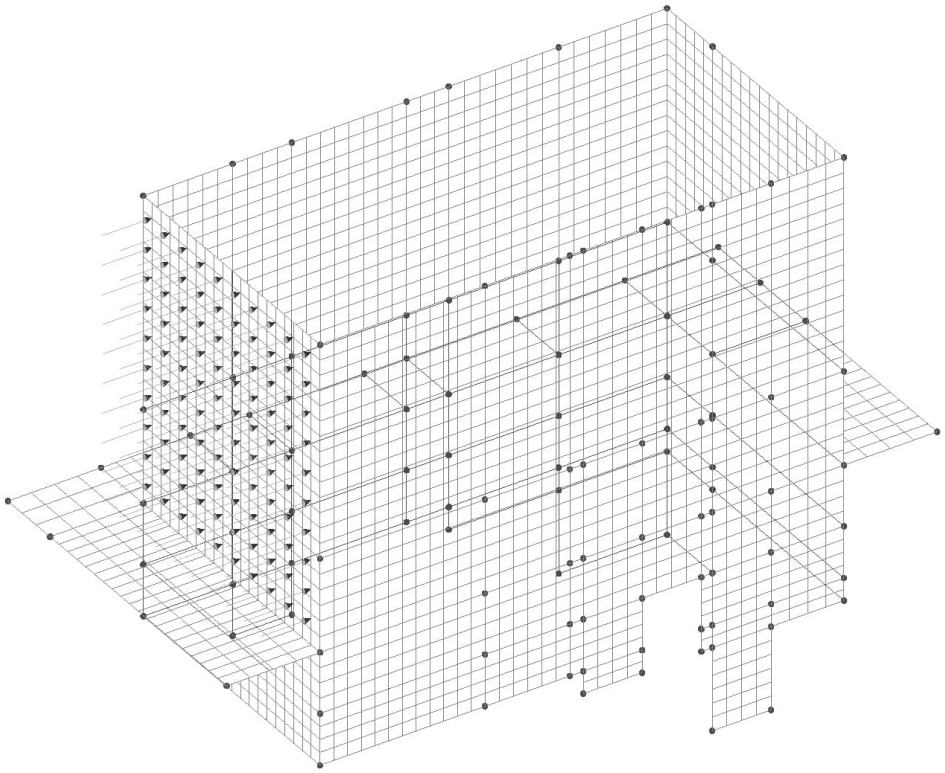
4	-21,9	5,75	78,0	3,8



3.4.3 Load combinations

Load combination smart : *LS*

Loadcase	Permanent factor	Variable factor
LS Wall 1 - V	0	1.00
LS Wall 2 – V	0	1.00
LS Wall 4 – V	0	1.00
LS Wall 1 – H	0	1.00
LS Wall 2 – H	0	1.00
LS Wall 4 – H	0	1.00

3.5 EARTHQUAKE LOADS

The effect of earthquake is considered by using at simplified method. The method increases the effect of dead weight as seen below (see also OTR 5.6.4).

In order to apply load to structure it is necessary to divide it into several load cases. A total of 8(16) load cases are required.

3.5.1 Unusual loading (UE)

The effect is considered by increasing load case dead weight in both vertical and horizontal directions. But in the evaluation of walls only the horizontal effect is considered.

The load case UE is divided into smaller load cases depending on which wall is considered as seen below.

Basic load cases :

Loadcase	Load	Load factor
UE Wall 1+	UE Wall 1	+1
UE Wall 1-	UE Wall 1	-1
UE Wall 2+	UE Wall 2	+1
UE Wall 2-	UE Wall 2	-1
UE Wall 3+	UE Wall 3	+1
UE Wall 3-	UE Wall 3	-1
UE Wall 4+	UE Wall 4	+1
UE Wall 4-	UE Wall 4	-1

Loadcombination smart : *UE*

Loadcase	Permanent factor	Variable factor
UE: Wall 1+	0	1.0
UE: Wall 1-	0	1.0
UE: Wall 2+	0	1.0
UE: Wall 2-	0	1.0
UE : Wall 3+	0	1.0
UE : Wall 3-	0	1.0
UE : Wall 4+	0	1.0
UE : Wall 4-	0	1.0

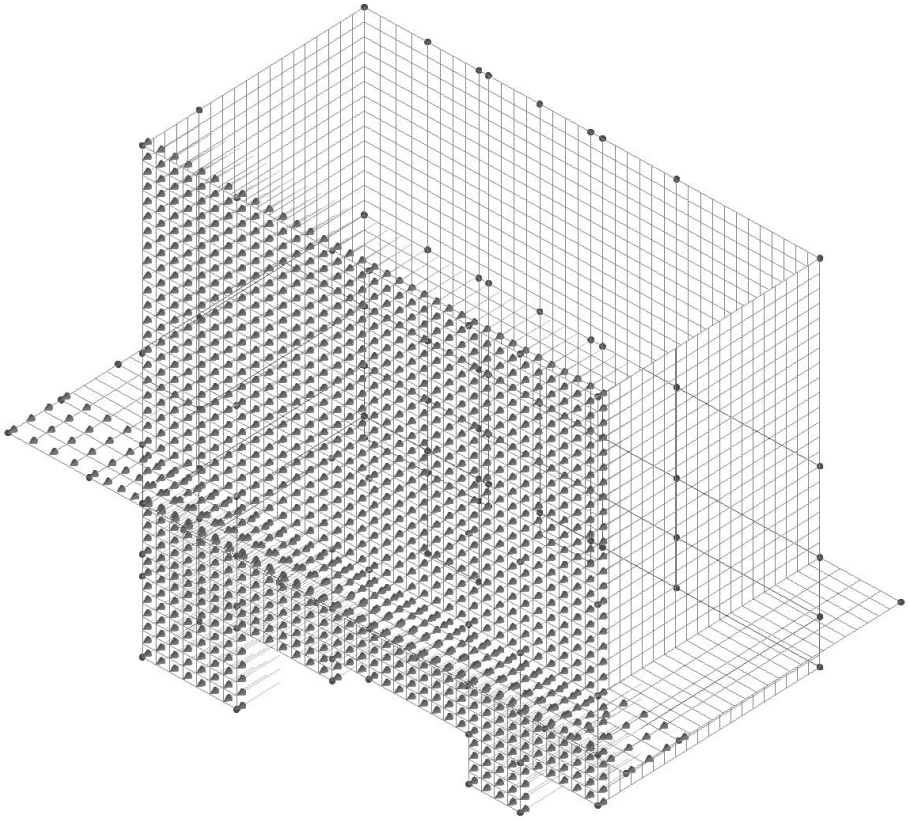
3.5.1.1 Load acting on wall 1 (Load : UE Wall 1)

Structural loading : Body force

Acceleration in y direction (a_y) : 1 $\frac{m}{s^2}$

Component	Value
Linear acceleration in X	0,0
Linear acceleration in Y	1,0
Linear acceleration in Z	0,0
Angular velocity about X axis	0,0
Angular velocity about Y axis	0,0
Angular velocity about Z axis	0,0
Angular acceleration about X axis	0,0
Angular acceleration about Y axis	0,0
Angular acceleration about Z axis	0,0

Attribute UE Wall 1 (9)



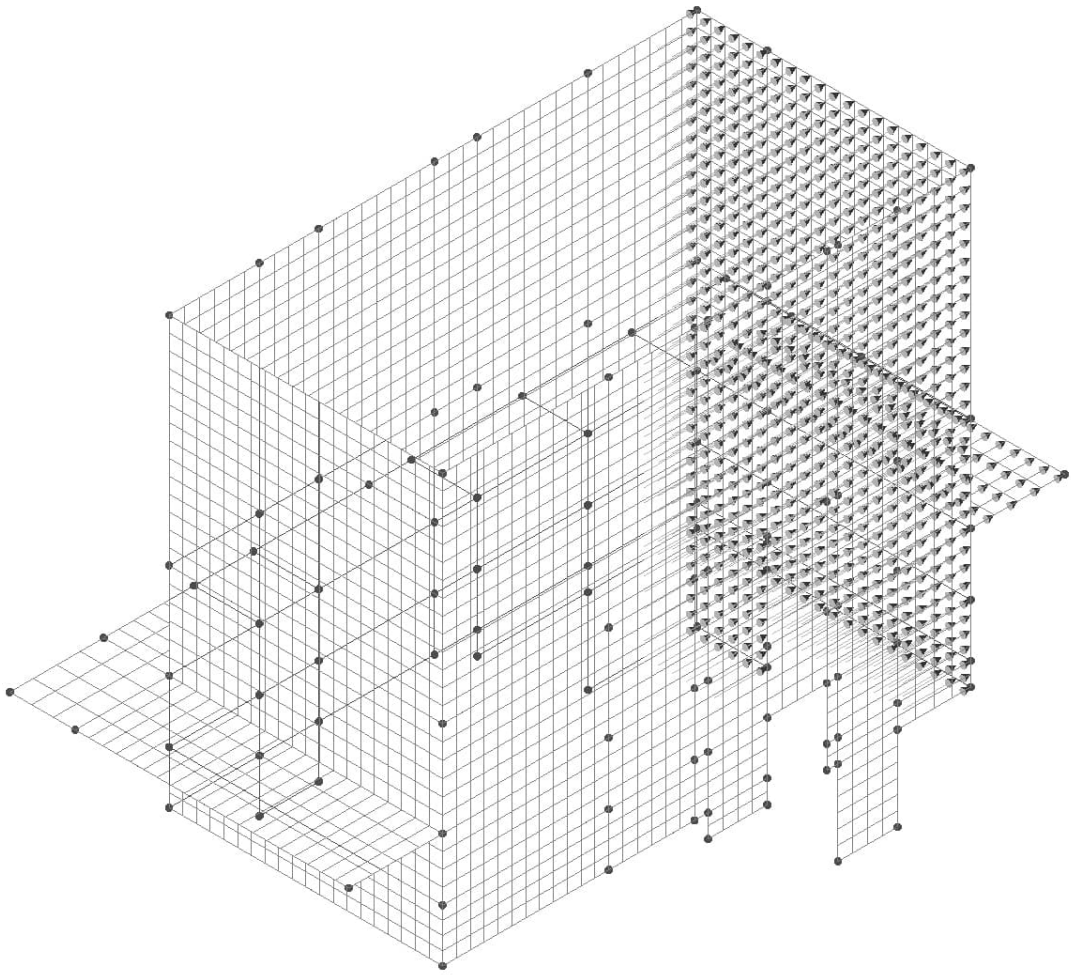
3.5.1.2 Load acting on wall 2 (Load : UE Wall 2)

Structural loading : Body force

Acceleration in x direction (a_x) : 1 $\frac{m}{s^2}$

Component	Value
Linear acceleration in X	1,0
Linear acceleration in Y	0,0
Linear acceleration in Z	0,0
Angular velocity about X axis	0,0
Angular velocity about Y axis	0,0
Angular velocity about Z axis	0,0
Angular acceleration about X axis	0,0
Angular acceleration about Y axis	0,0
Angular acceleration about Z axis	0,0

Attribute UE Wall 2 (10)



..

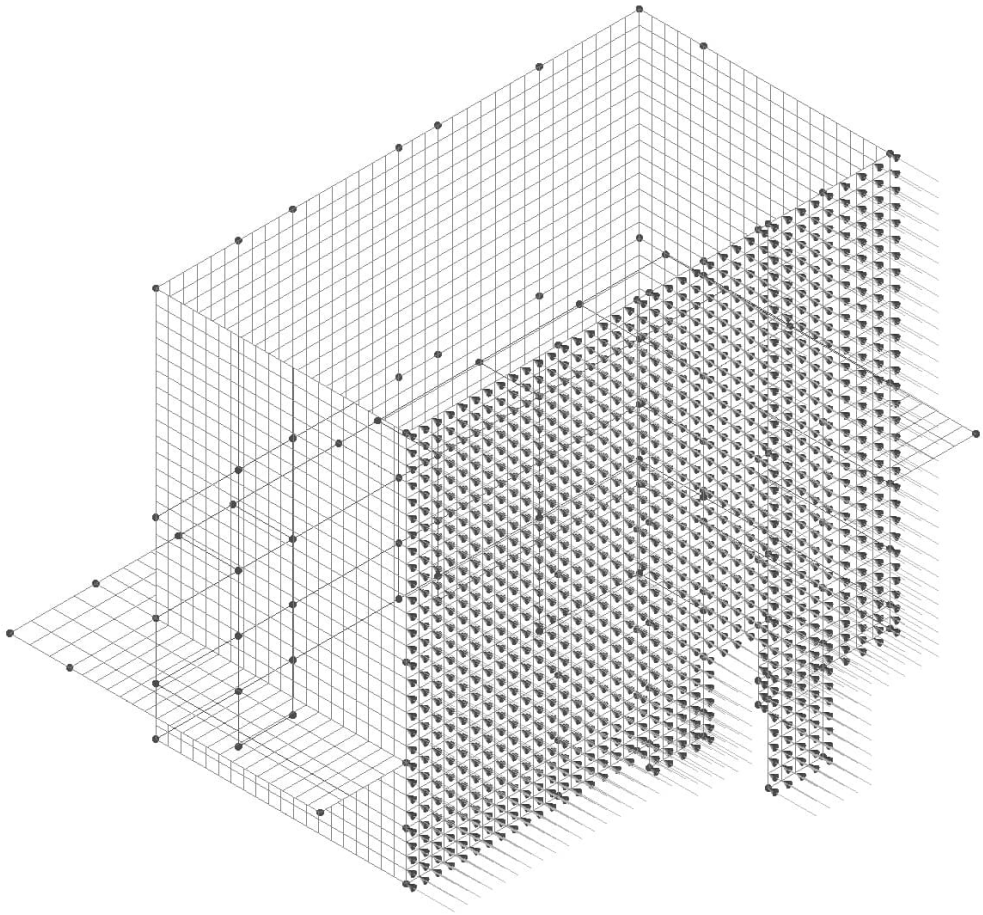
3.5.1.3 Load acting on wall 3 (Load : UE Wall 3)

Structural loading : Body force

Acceleration in y direction (a_y) : 1 $\frac{m}{s^2}$

Component	Value
Linear acceleration in X	0,0
Linear acceleration in Y	1,0
Linear acceleration in Z	0,0
Angular velocity about X axis	0,0
Angular velocity about Y axis	0,0
Angular velocity about Z axis	0,0
Angular acceleration about X axis	0,0
Angular acceleration about Y axis	0,0
Angular acceleration about Z axis	0,0

Attribute UE Wall 3 (11)



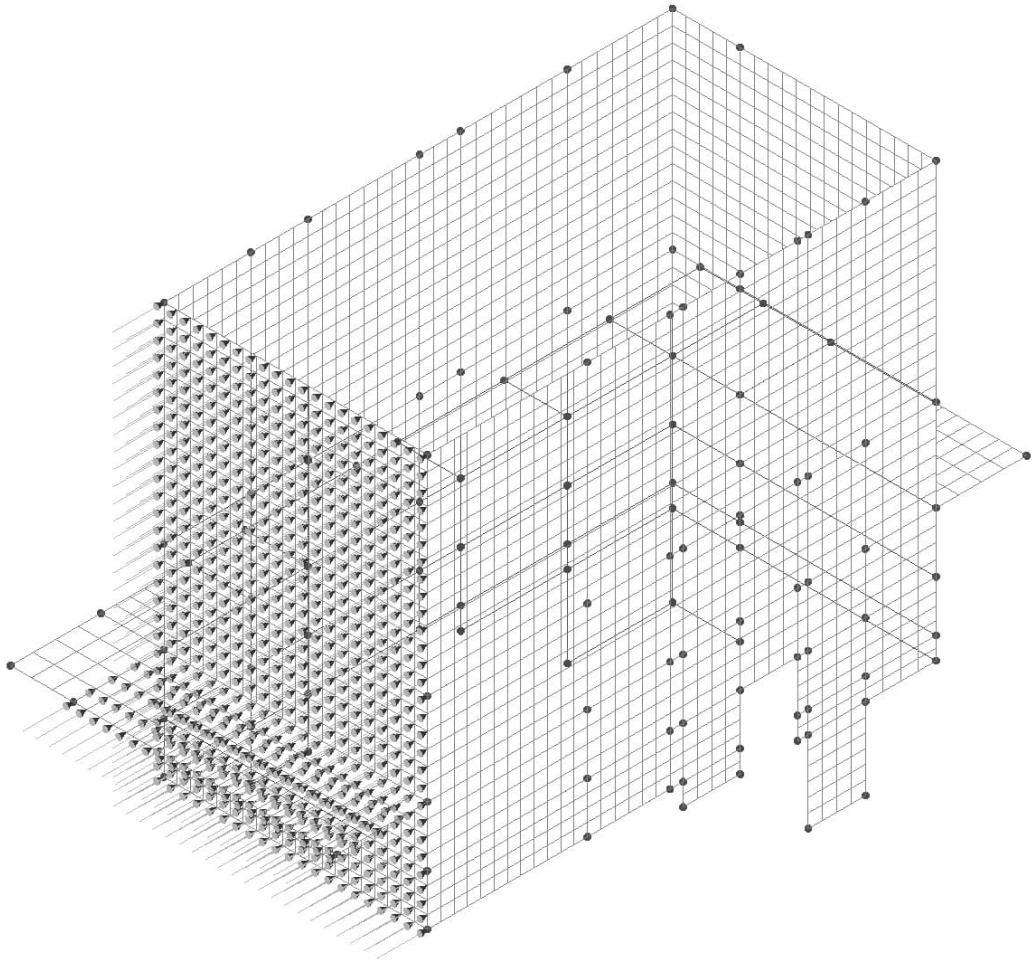
3.5.1.4 Load acting on wall 4 (Load : UE Wall 4)

Structural loading : Body force

Acceleration in x direction (a_x) : 1 $\frac{m}{s^2}$

Component	Value
Linear acceleration in X	1,0
Linear acceleration in Y	0,0
Linear acceleration in Z	0,0
Angular velocity about X axis	0,0
Angular velocity about Y axis	0,0
Angular velocity about Z axis	0,0
Angular acceleration about X axis	0,0
Angular acceleration about Y axis	0,0
Angular acceleration about Z axis	0,0

Attribute UE Wall 2 (10)



3.5.2 Extreme loading (EE)

The effect is considered by increasing load case dead weight by 15 % in both vertical and horizontal directions. But in the evaluation of walls only the horizontal effect is considered.

Since EE is identical with UE apart from load intensity it stresses is retrieved by scaling results with a factor of 1.5 as seen below.

Loadcombination smart : *EE*

Loadcase	Permanent factor	Variable factor
UE (Max)	0	1.5
UE (Min)	0	1.5

3.6 LOAD COMBINATIONS

Load combinations below are considered.

LC:I Ultimate limit state
LC :II Service limit state with the objective crack control
LC:III Extreme limit state (operational basis earthquake / OBE)
LC:IV Extreme limit state (maximum credible earthquake / MCE)
LC:V Extreme limit state (10 000 year flood earthquake / MCE)

3.6.1 LC:I Ultimate limit state

The load combination has varying water levels. The water level is either at level H0 or H2. Due to this table below has to be adapted using an envelope of the different water levels.

Load case	Load factor	Remark
DC	1.17 / 2.21	Dead weight
EH	1.17 / 2.21	Horizontal earth pressure
WA	0 / 2.21	Water loads
LS	0 / 2.21	Surcharge

Loadcombination smart *LC:I – H0 :*

Loadcase	Permanent factor	Variable factor
